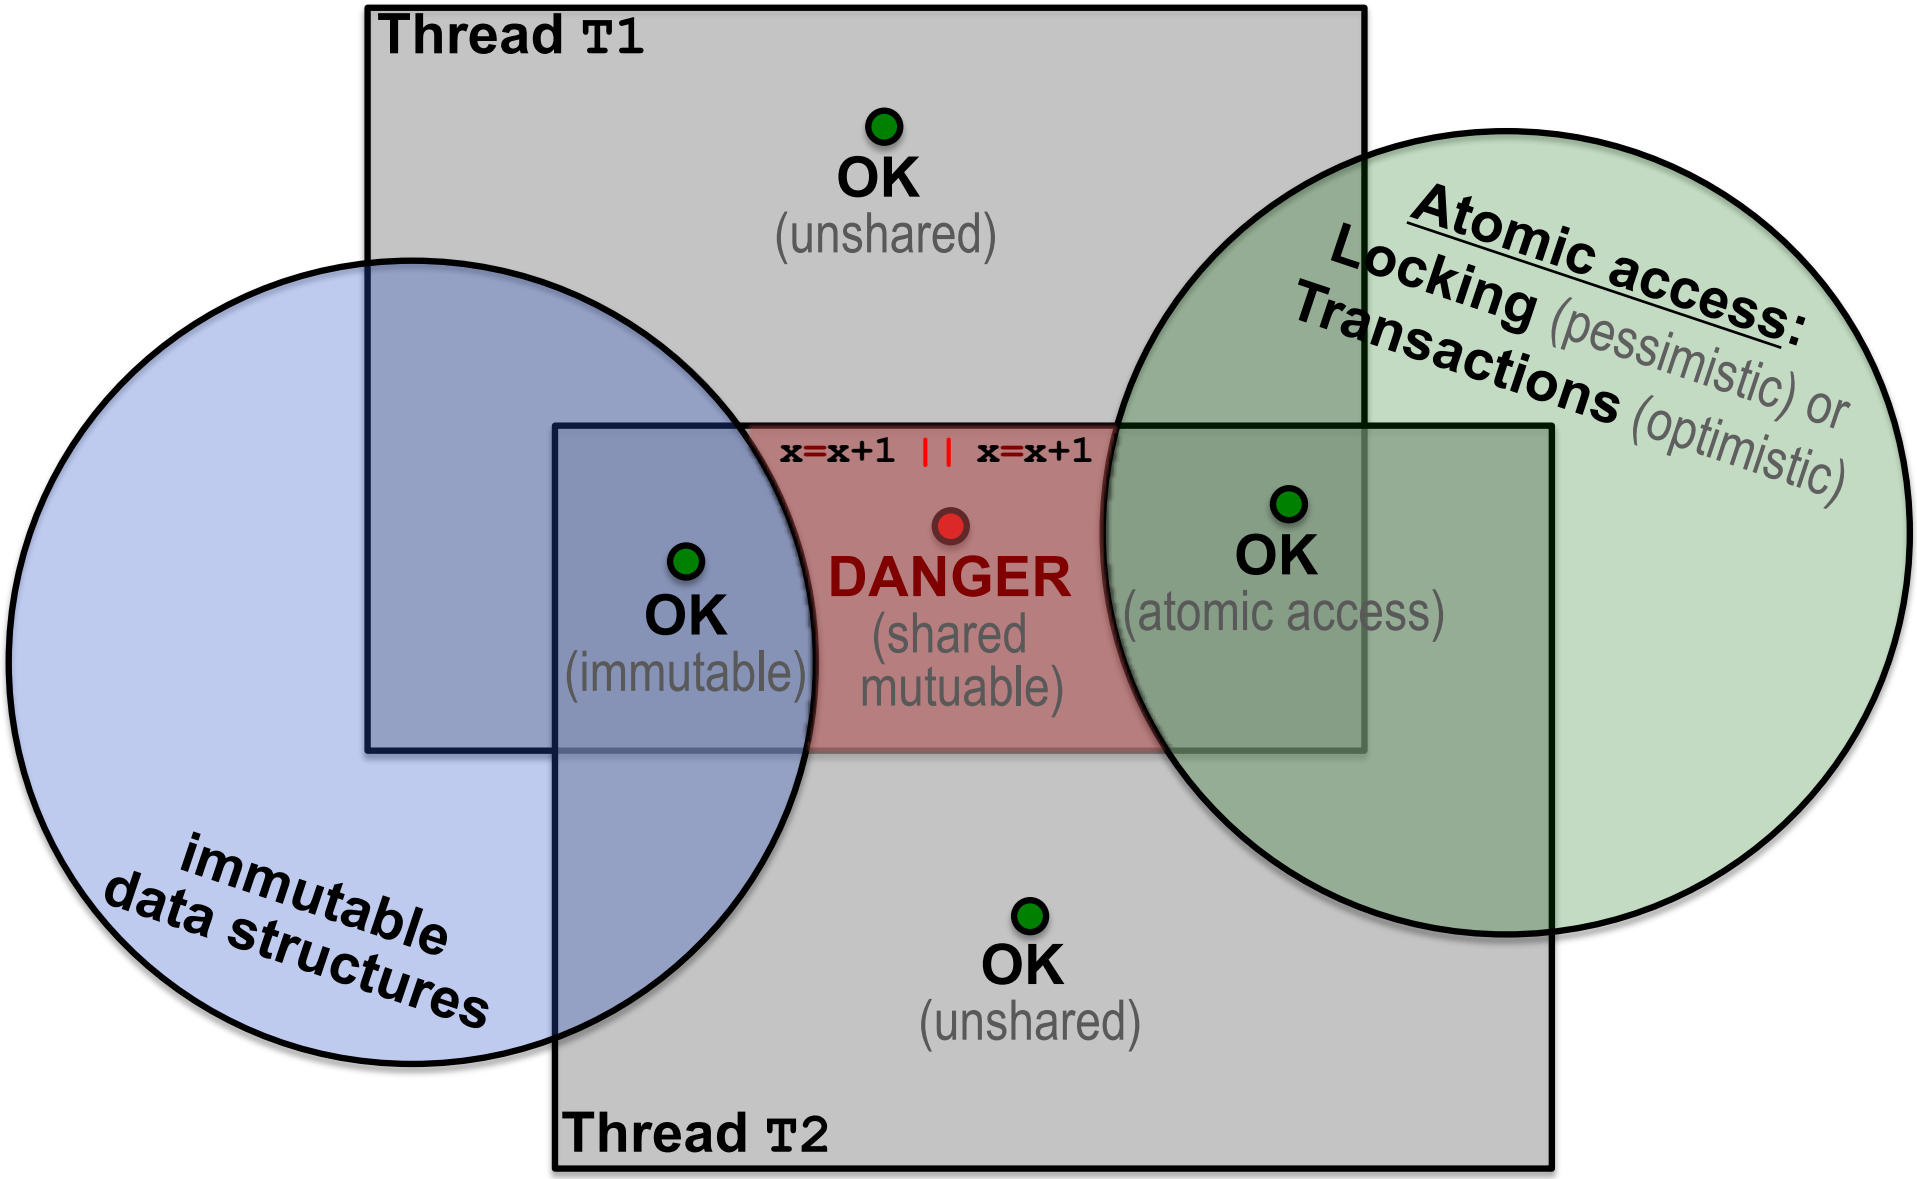
Recap

Introduction to Message Passing

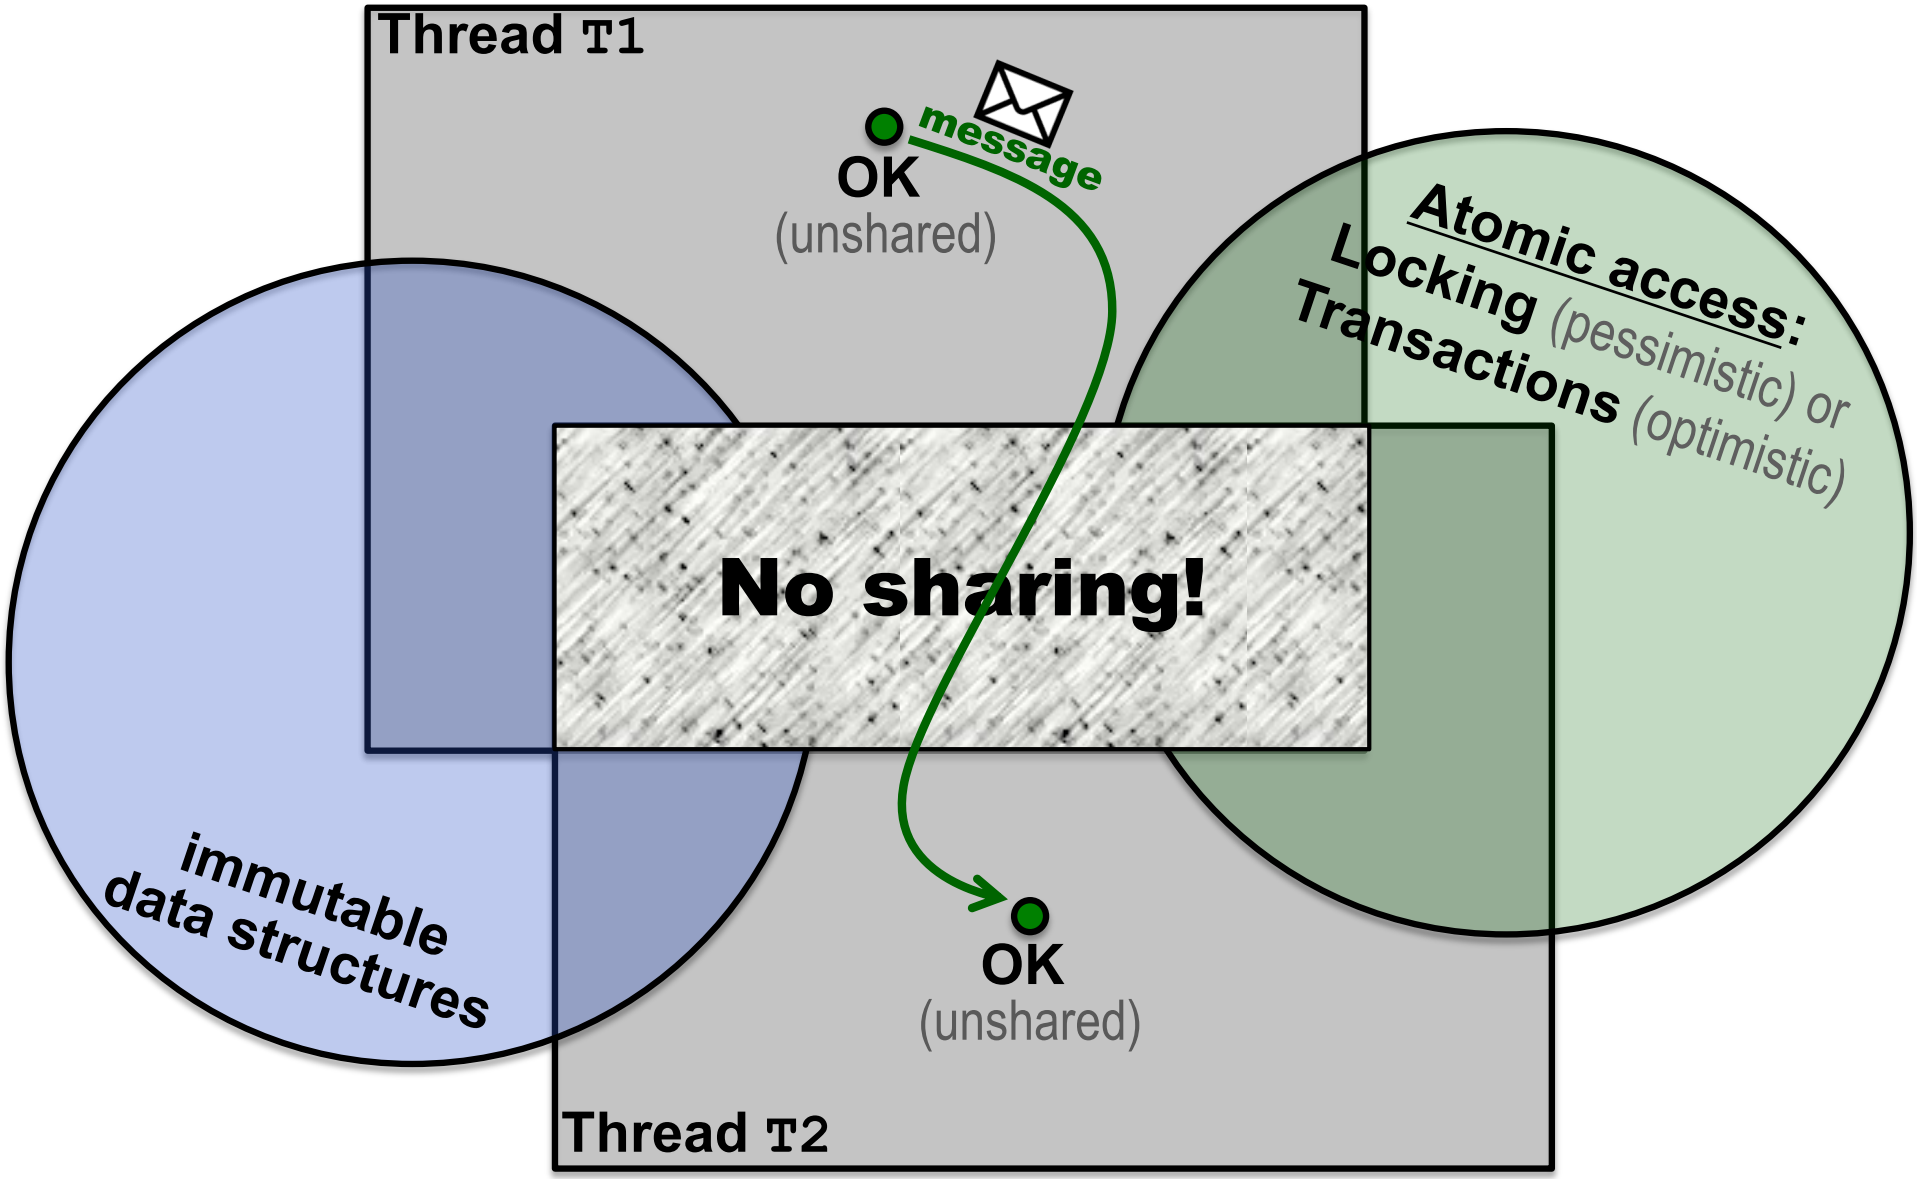
PROBLEM:
Sharing && Mutability!

SOLUTIONS:
1) atomic access!
   locking or transactions
   NB: avoid deadlock!
2) avoid mutability!
3) avoid sharing...



PROBLEM:
Sharing && Mutability!

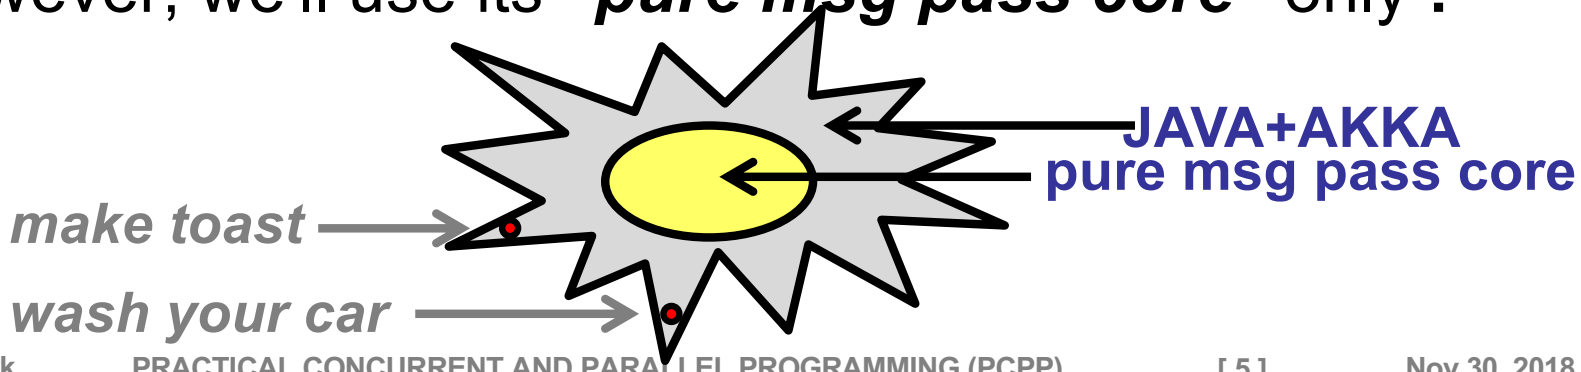
SOLUTIONS:
1) atomic access!
   locking or transactions
   NB: avoid deadlock!
2) avoid mutability!
3) avoid sharing...



Philosophy & Expectations!

- **ERLANG:**
  - We'll use as message passing ***specification language***
  - You have to-be-able-to ***read*** simple **ERLANG** programs
    - (i.e., not ***write***, nor ***modify***)
- **JAVA+AKKA:**
  - We'll use as msg passing ***implementation language***
  - You have 2-b-a-2 ***read/write/modify*** **JAVA+AKKA** p's
  - However, we'll use its ***"pure msg pass core"*** only **!**

NB: we're **not** going to use all of its fantazilions of functions!

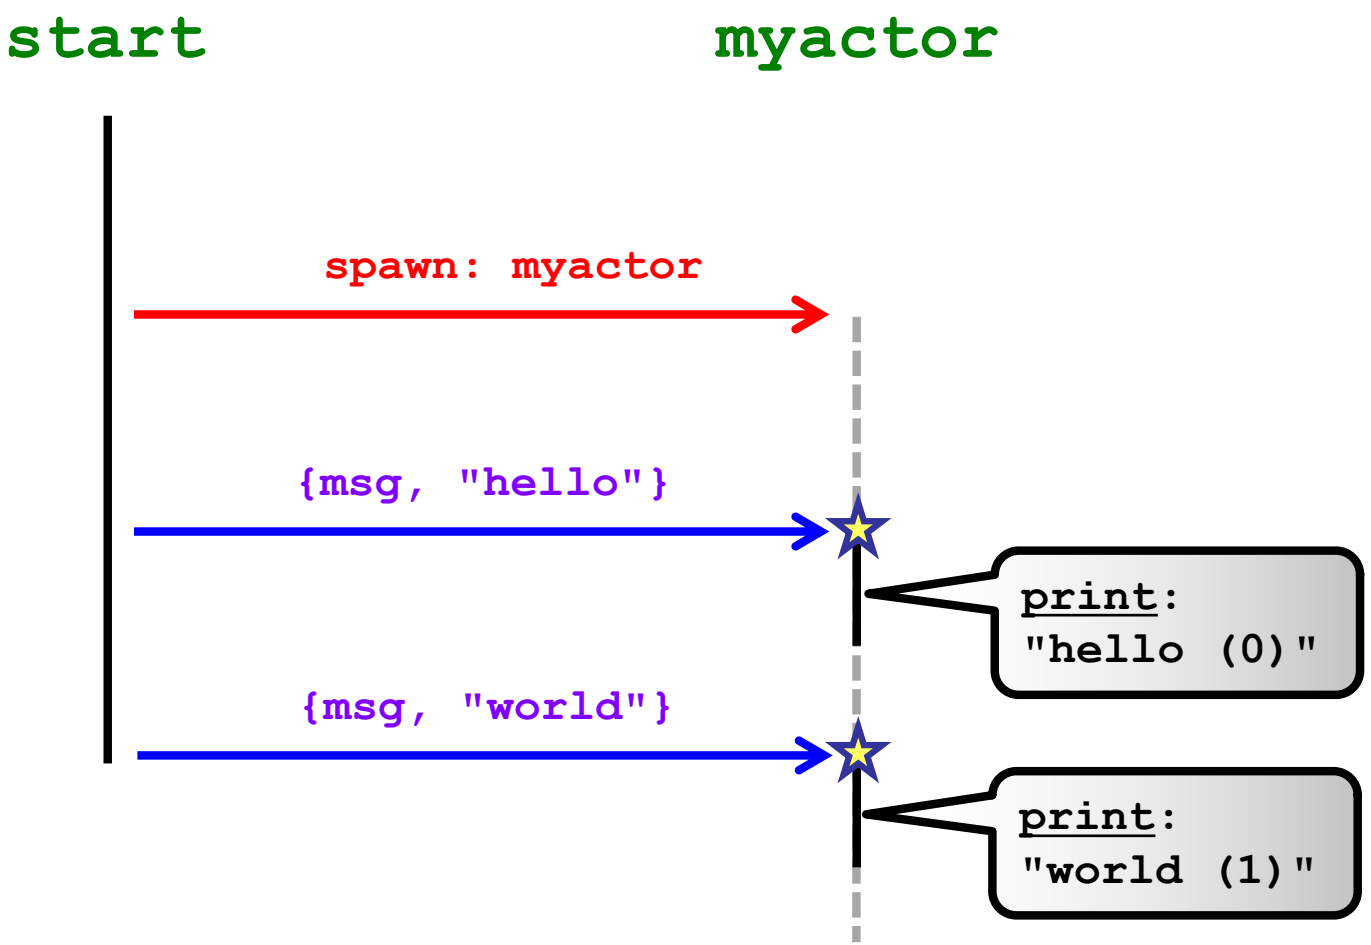


Actor: Send / Receive / Spawn

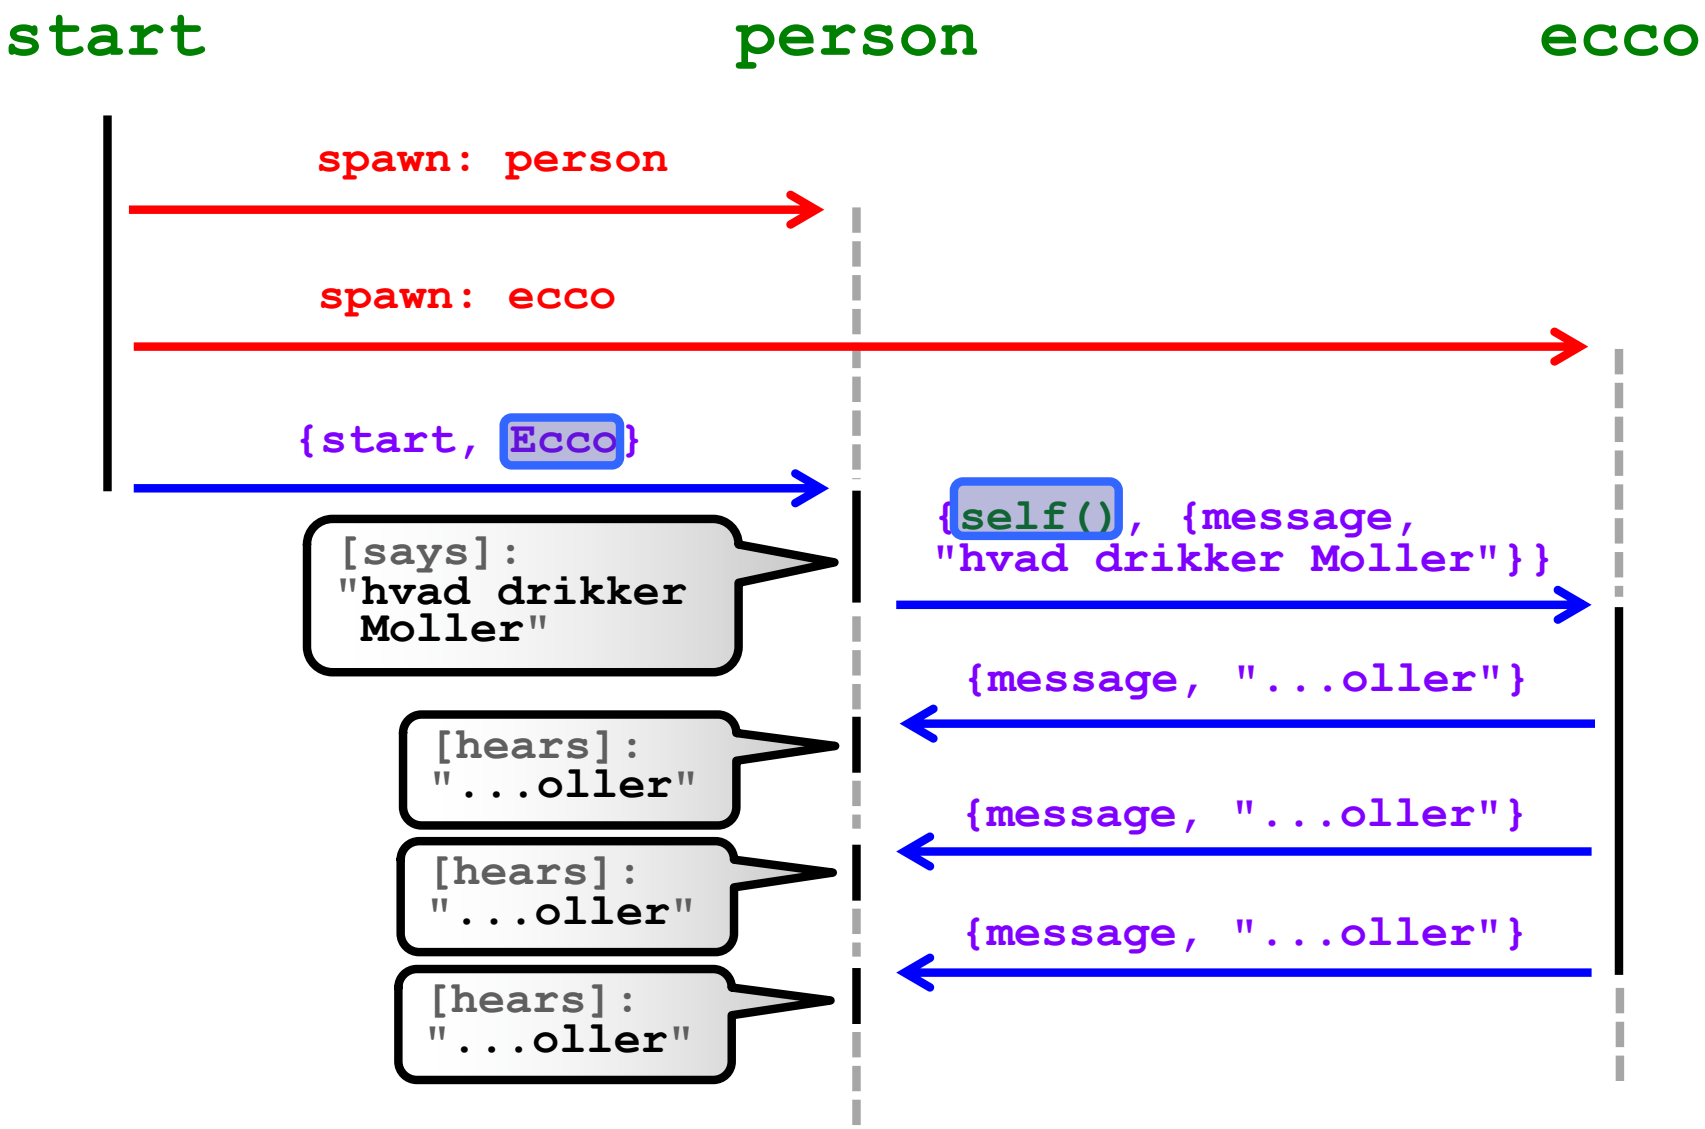
- **Send:**
  - `Pid ! M` // Message M is sent to process Pid
  - `Pid ! {some, {complex, structured, [m,s,g]}, 42}`
- **Receive:**
  -
```
receive
    pattern1 -> ...
    ;
    pattern2 -> ...
end
```
```
receive
    {init,N} when N>0 -> ...
    ;
    {init,N} -> ...
end
```
- **Spawn:**
  - `MyActorId = 'spawn'(mymodule,myactor,[a,r,g,s])`

1) HelloWorld

LEGEND:
send, receive, msgs
actors, spawn, rest.



2) Ecco



start
person
ecco
spawn: person
spawn: ecco
{start, Ecco}
[says]: "hvad drikker Moller"
{self(), {message, "hvad drikker Moller"}}
{message, "...oller"}
[hears]: "...oller"
{message, "...oller"}
[hears]: "...oller"
{message, "...oller"}
[hears]: "...oller"

AGENDA

- 3) **Broadcast:**

  Broadcaster ! {unsubscribe,P2},
  Broadcaster ! {message,"Shoes half price!!"}.
```

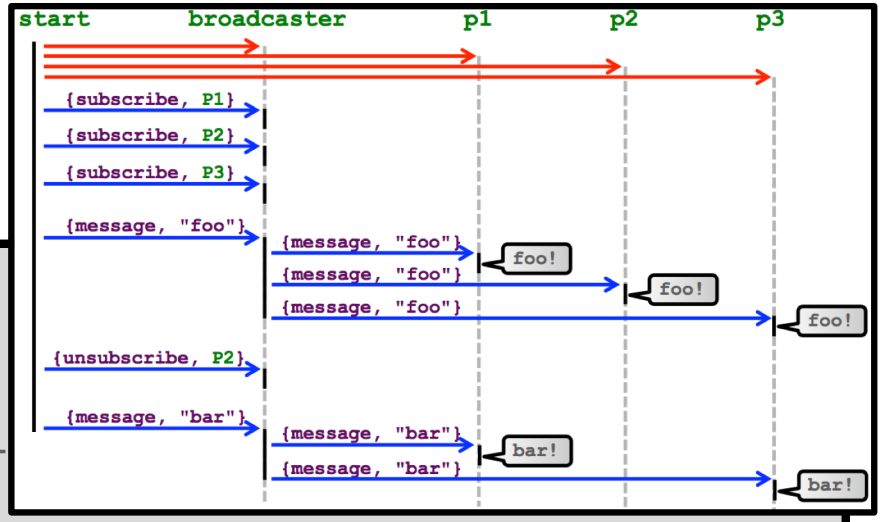
3) Broadcast.java



```
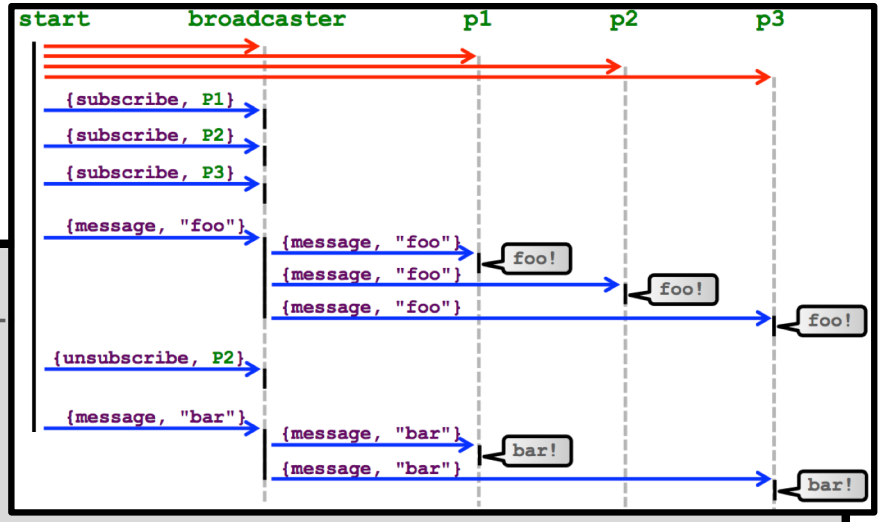
// -- ACTORS ----------------------------------

class PersonActor extends UntypedActor {
   public void onReceive(Object o) throws Exc' {
      if (o instanceof Message) {
         System.out.println(((Message) o).s);
      }
   }
}

class BroadcastActor extends UntypedActor {
   private List<ActorRef> list =
      new ArrayList<ActorRef>();

   public void onReceive(Object o) throws Exception {
      if (o instanceof SubscribeMessage) {
         list.add(((SubscribeMessage) o).subscriber);
      } else if (o instanceof UnsubscribeMessage) {
         list.remove(((UnsubscribeMessage) o).unsubscriber);
      } else if (o instanceof Message) {
         for (ActorRef person : list) {
            person.tell(o, getSelf());
         }
      }
   }
}
```



```
person() ->
  receive
    {message,M} ->
       io:fwrite(M ++ "\n"),
       person()
  end.
```

```
broadcaster(L) ->
  receive
    {subscribe,Pid} ->
      broadcaster([Pid|L]) ;
    {unsubscribe,Pid} ->
      broadcaster( L \ Pid );
    {message,M} ->
      % ∀P∈L : send M to P,
      broadcaster(L)
  end.
```

3) Broadcast.java

- **Compile:**

```
javac -cp scala.jar:akka-actor.jar Broadcast.java
```

- **Run:**

```
java -cp scala.jar:akka-actor.jar:akka-config.jar:. Broadcast
```

- **Output:**

```
purses half price!
purses half price!
purses half price!
shoes half price!!
shoes half price!!
```

The world's leading Q&A site

Why the Sudden Popularity?!?

- Recently, processor speed "hit the wall":
  - ***Speed of causality*** *(light in vacuum)**:***
    - `c = 300 000 000 m/s` meters/second
  - ***Processor speed*** *(about 3 GHz)**:***
    - `p = 3 000 000 000 x/s` instructions/second

- Computers are really really fast:

$$\frac{c}{p} = \frac{300\,000\,000\ m/s}{3\,000\,000\,000\ x/s} = \frac{3\ m}{30\ x} = 0.1\ m/x$$

  - *i.e.,* ***light travels 0.1 m = 10 cm per instruction !***

Why the Sudden Popularity?!?

- **Before** (more speed):

  - **Moore's Law:** #Transistors-per-CPU doubles every 1.8 years
  - **Dennard Scaling:** Performance-per-Watt doubled every 1.6 years
    (until ~2006)

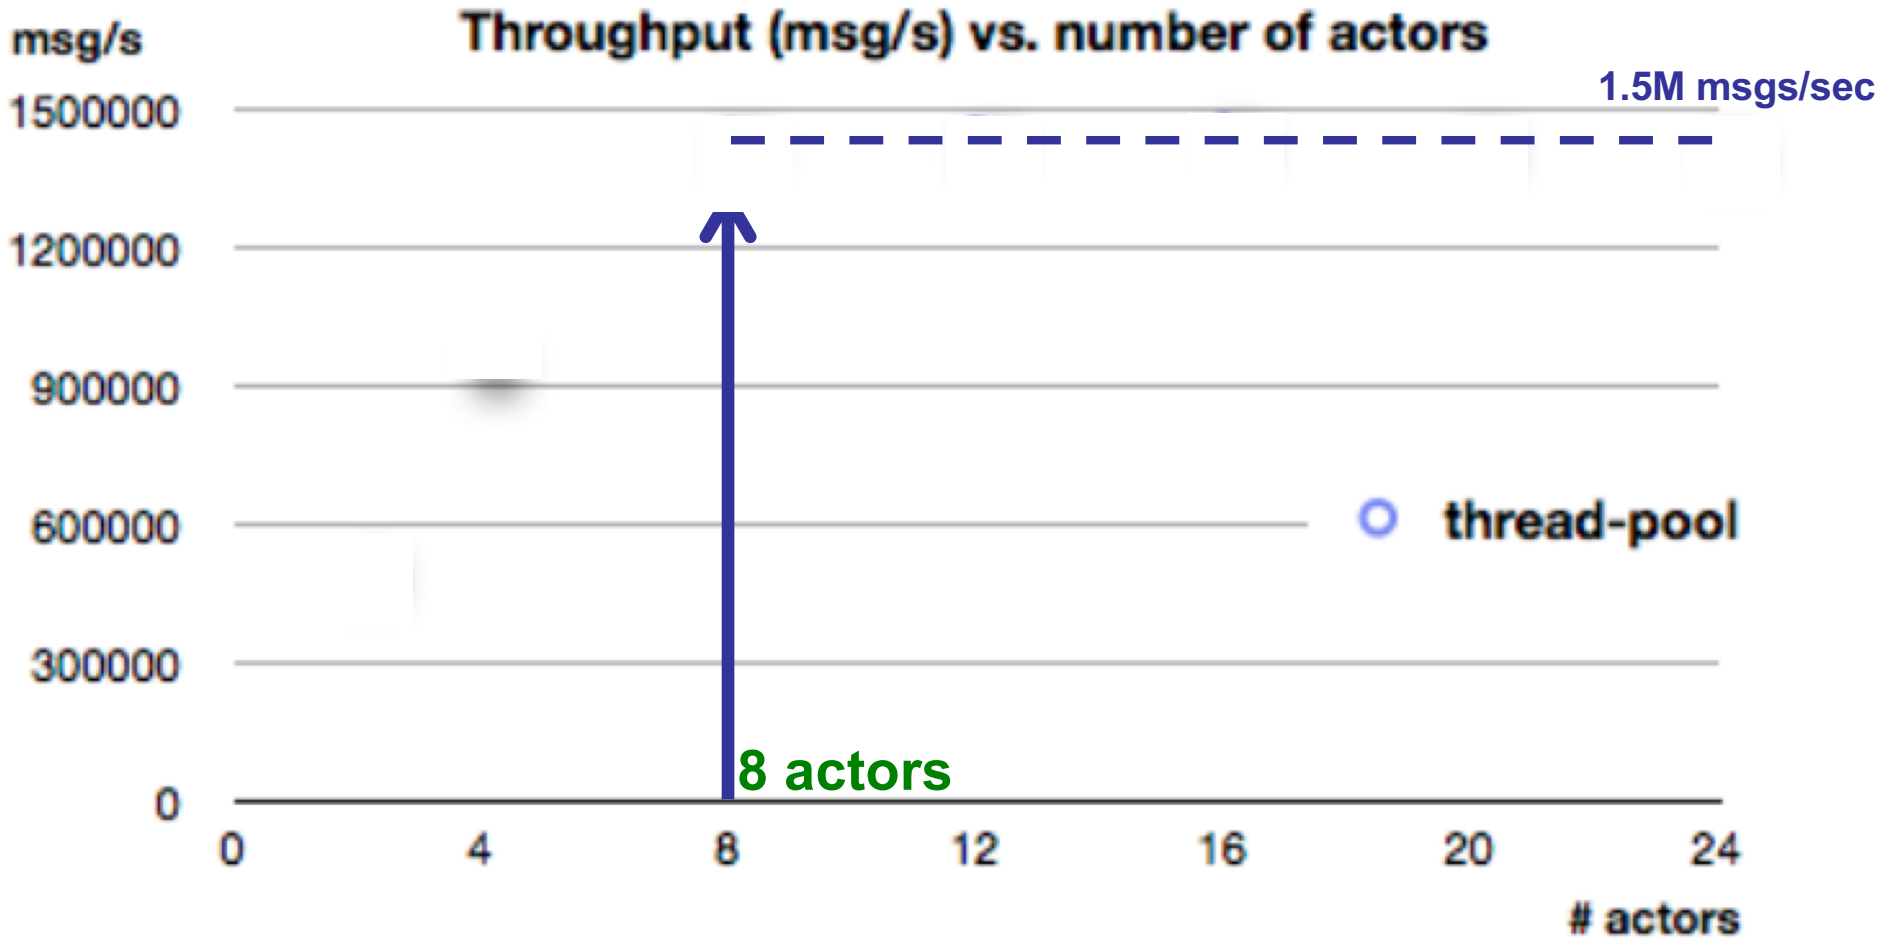
- **Now** (if we want more speed):
  - We have to ***increase parallelism !***
  - Recent developments: ***"Work Stealing Queue"***

Chase and Lev: ***"Dynamic Circular Work-Stealing Queue"***, SPAA **2005**
Michael, Vechev, Saraswat: ***"Idempotent Work Stealing"***, PPoPP **2009**

used for: managing the actors effectively

Scalability? :-(

- Using a conventional "Thread Pool Executor":



[From "UP UP AND OUT: SCALING SOFTWARE WITH AKKA", Jonas Boner, GOTO Conference, Aarhus, Denmark]

Scalability? :-(

Actors

Definition of an Actor

The People Metaphor

An Actor is...:

- A fundamental ***unit of computation*** that embodies:
  - 1) **Processing** (usually simple)
  - 2) **State** (local)
  - 3) **Communication**

- **In particular: no shared && mutable state!**

- When an actor receives a message, it can...:
  - 1) **perform computation**
  - 2) **change state**
  - 3) **send messages to actors it knows**
  - +) **spawn new actors!**

Actors & Msg Passing: Benefits

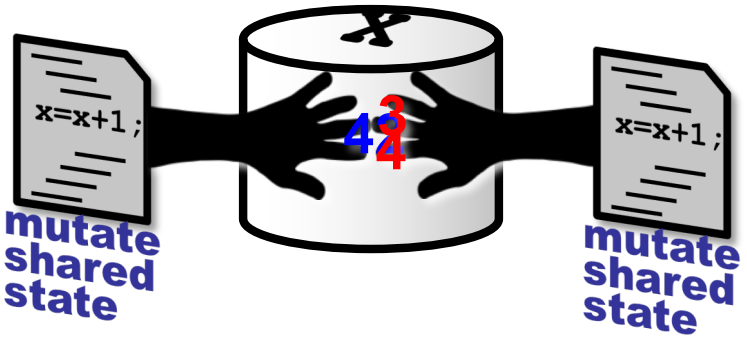
- **Correct highly concurrent systems:**
  - Higher level abstraction (via message passing)
    - coordination (declarative/what) ≠ heap mgmt (imperative/how)
  - No low-level locking (no shared && mutable state)
- **Truly scalable systems:**
  - Actors are extremely lightweight entities
  - Actors are ***location transparent***
    - => Distributable-by-design
  - Transparently map MP programs onto given hardware:
    - "Scale up" (more processors), "Scale out" (more machines)
- **Self-healing, fault-tolerant systems:**
  - Adaptive load balancing and actor migration
  - "Let it crash" model (deal w/ failure, great succes in telecom industry)
  - Manage system overload (graceful service degradation)

Actors & Msg Passing: Drawbacks

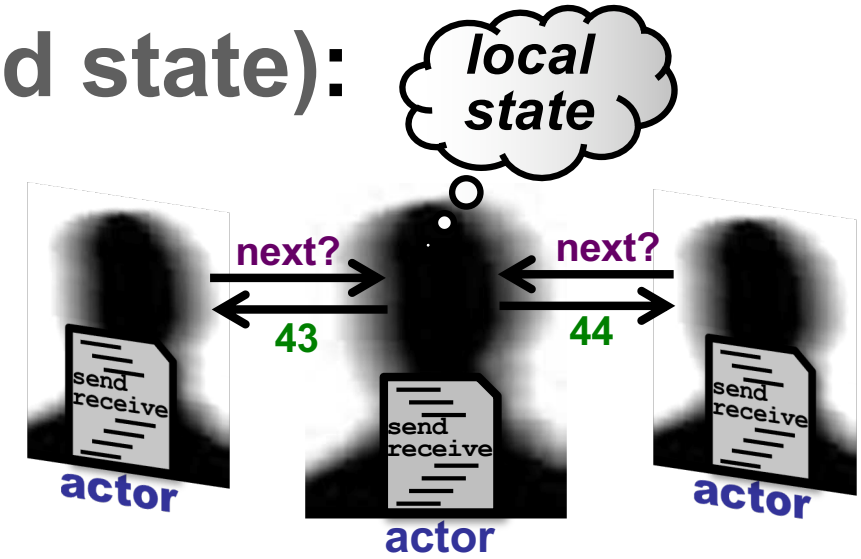
- **New & different paradigm:**
  - Learning curve: programmers unfamiliar with paradigm
- **Overhead of (high level) message passing:**
  - Overhead of sending messages:
    - Less efficient than shared && mutable state
  - (Analogy: explicit memory mgmt vs garbage collection)
- **The Correlation problem:**
  - `A --what-is-your-favorite-fruit?--> B`
  - `A --what-is-your-favorite-color?--> B`
  - `B --orange--> A` // now: correlates with which request?!?
- **Hard to identify global state properties:**
  - i.e., computing: **`f(global-state)`**:
    - e.g., termination condition of a distributed algorithm

The People Metaphor

- **Shared Mutable state:**
  - Concurrency problems!
    - **Shared && mutable !**
  - Hard to (later) distribute!



- **Actors (with encapulated state):**
  - Can't "look inside head" of a living person (actor) !
  - Instead: **ask questions ?**
  - ...and **get responses !**
  - **...one at a time !**



The People Metaphor (cont'd)

- **Programming Metaphor:**
  - "The People Analogy"

- Think of it as **"coordinating lots of people":**
  - Each can do simple tasks
  - Consider workflow (of orders/messages in your system)

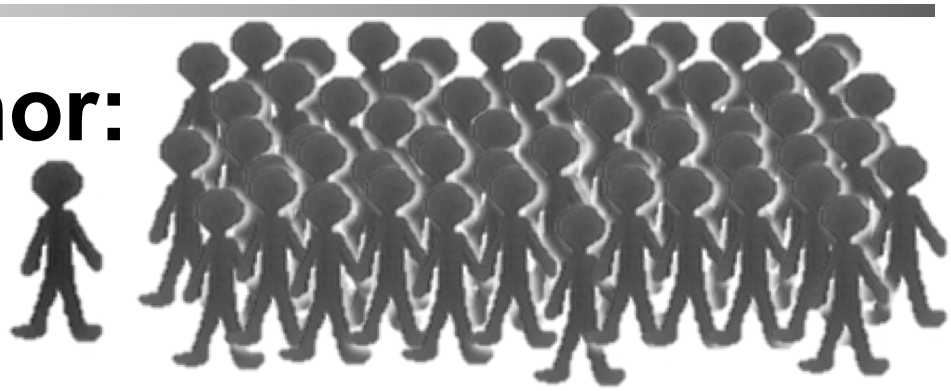
The People Metaphor (cont'd)

- **Programming Metaphor:**
  - "The People Analogy"

- Think of it as **"coordinating lots of people":**
  - Each can do simple tasks
  - Consider workflow (of orders/messages in your system)
  - Need more work ⇒ hire more people **(spawn more actors)**

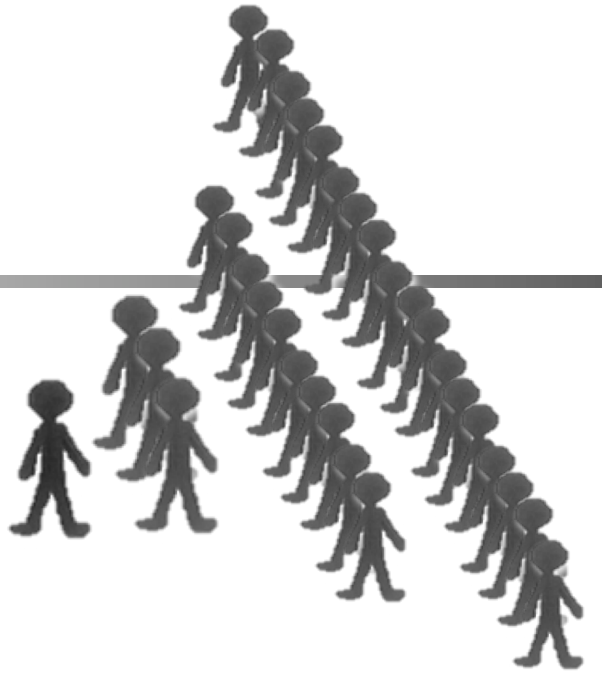
The People Metaphor (cont'd)

- **Programming Metaphor:**
  - "The People Analogy"



- Think of it as **"coordinating lots of people":**
  - Each can do simple tasks
  - Consider workflow (of orders/messages in your system)
  - Need more work ⇒ hire more people **(spawn more actors)**

The People Metaphor



- **Programming Metaphor:**
  - "The People Analogy"

- Think of it as **"coordinating lots of people":**
  - Each can do simple tasks
  - Consider workflow (of orders/messages in your system)
  - Need more work ⇒ hire more people **(spawn more actors)**
  - Hierarchic organization: managers supervise workers
  - Fault tolerance (expect failures and deal with them)

[AKKA documentation, § 2.2.3]

Recommendations

- **1) Actors should be like nice co-workers:**
  - do their job effectively w/o bothering others needlessly
  - should not roll thumbs (idle or blocking operations)
- **2) Actors should not send mutable objects:**
  - O/w we're back to "shared && mutable" ⇒ problems **!**
- **3) Actors should send data, not programs:**
  - O/w we're back to "shared && mutable" ⇒ problems **!**
  - (Note: ERLANG does not have higher-order functions)
- **4) Create few top-level actors:**
  - If these crash, your whole system will crash
  - If their workers die, they just hire (spawn) new ones

[AKKA documentation, § 2.2.1]

Recommendations

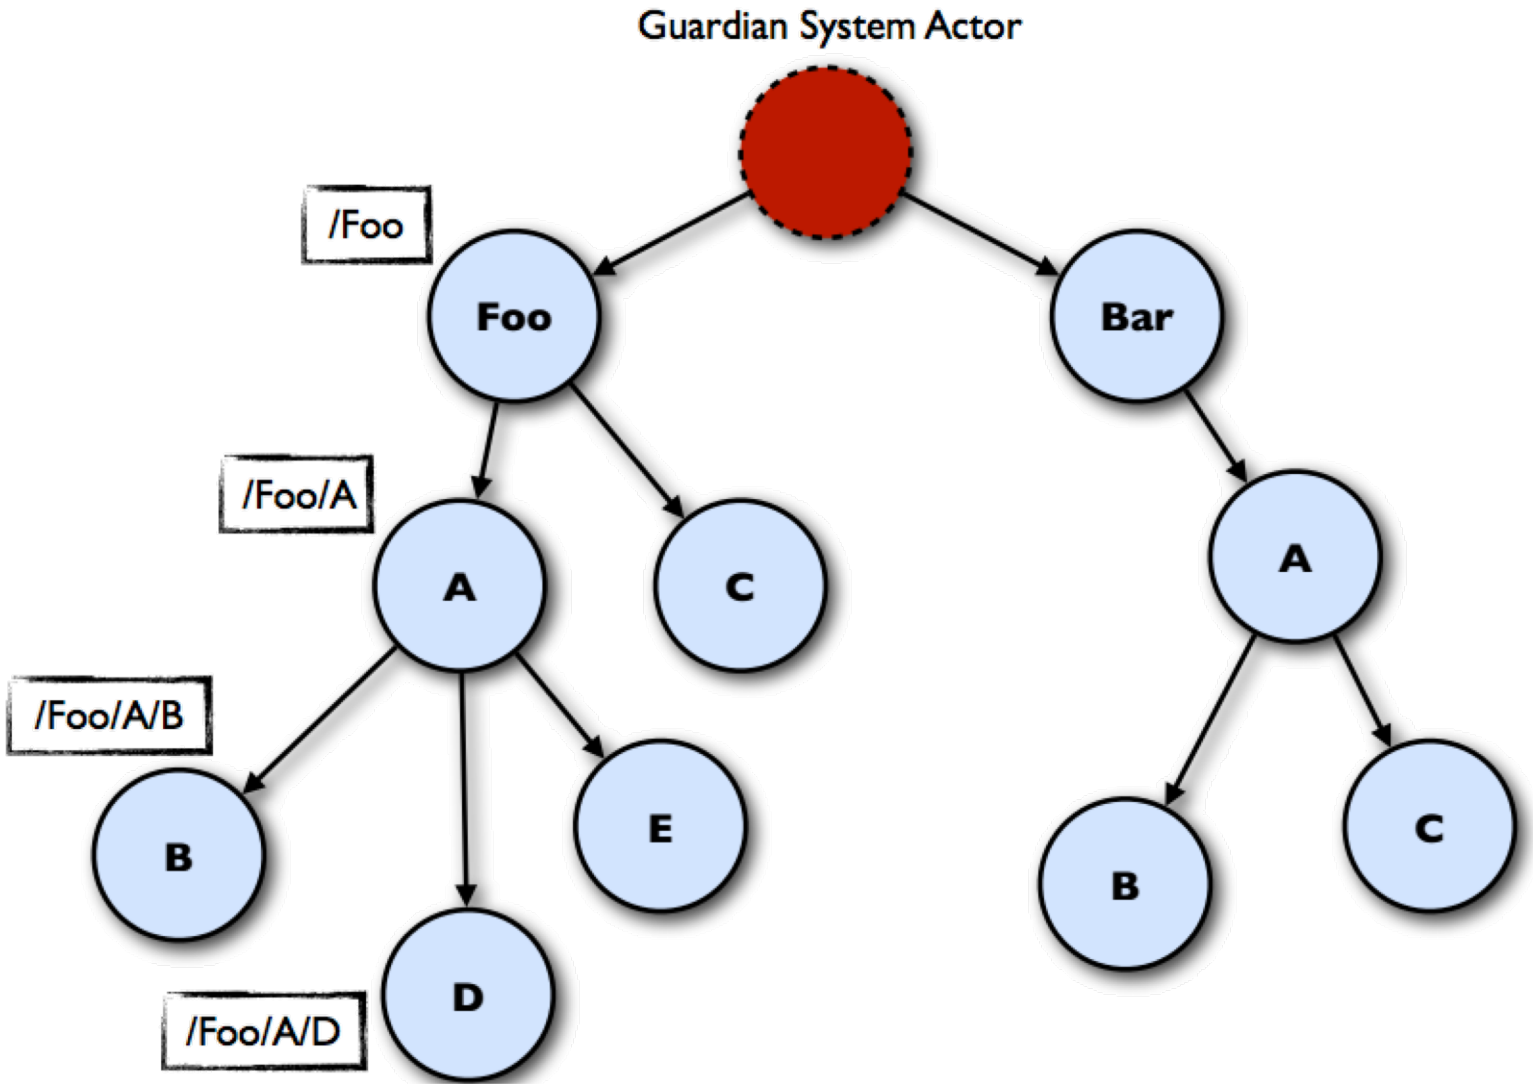
- **5) Managers should supervise Workers:**
  - organization as a hierarchy
  - pass on and schedule tasks for workers
  - "hire" (spawn) more workers by need
  - deal with failure (of your workers)
- **6) Actors should spawn workers for "dangerous operations"** (Qatar 2022 ?)**:**
  - avoid crashing with important data
  - spawn workers for "dangerous operations"
  - deal with failure (of your workers)

Scalability & Fault-Tolerance

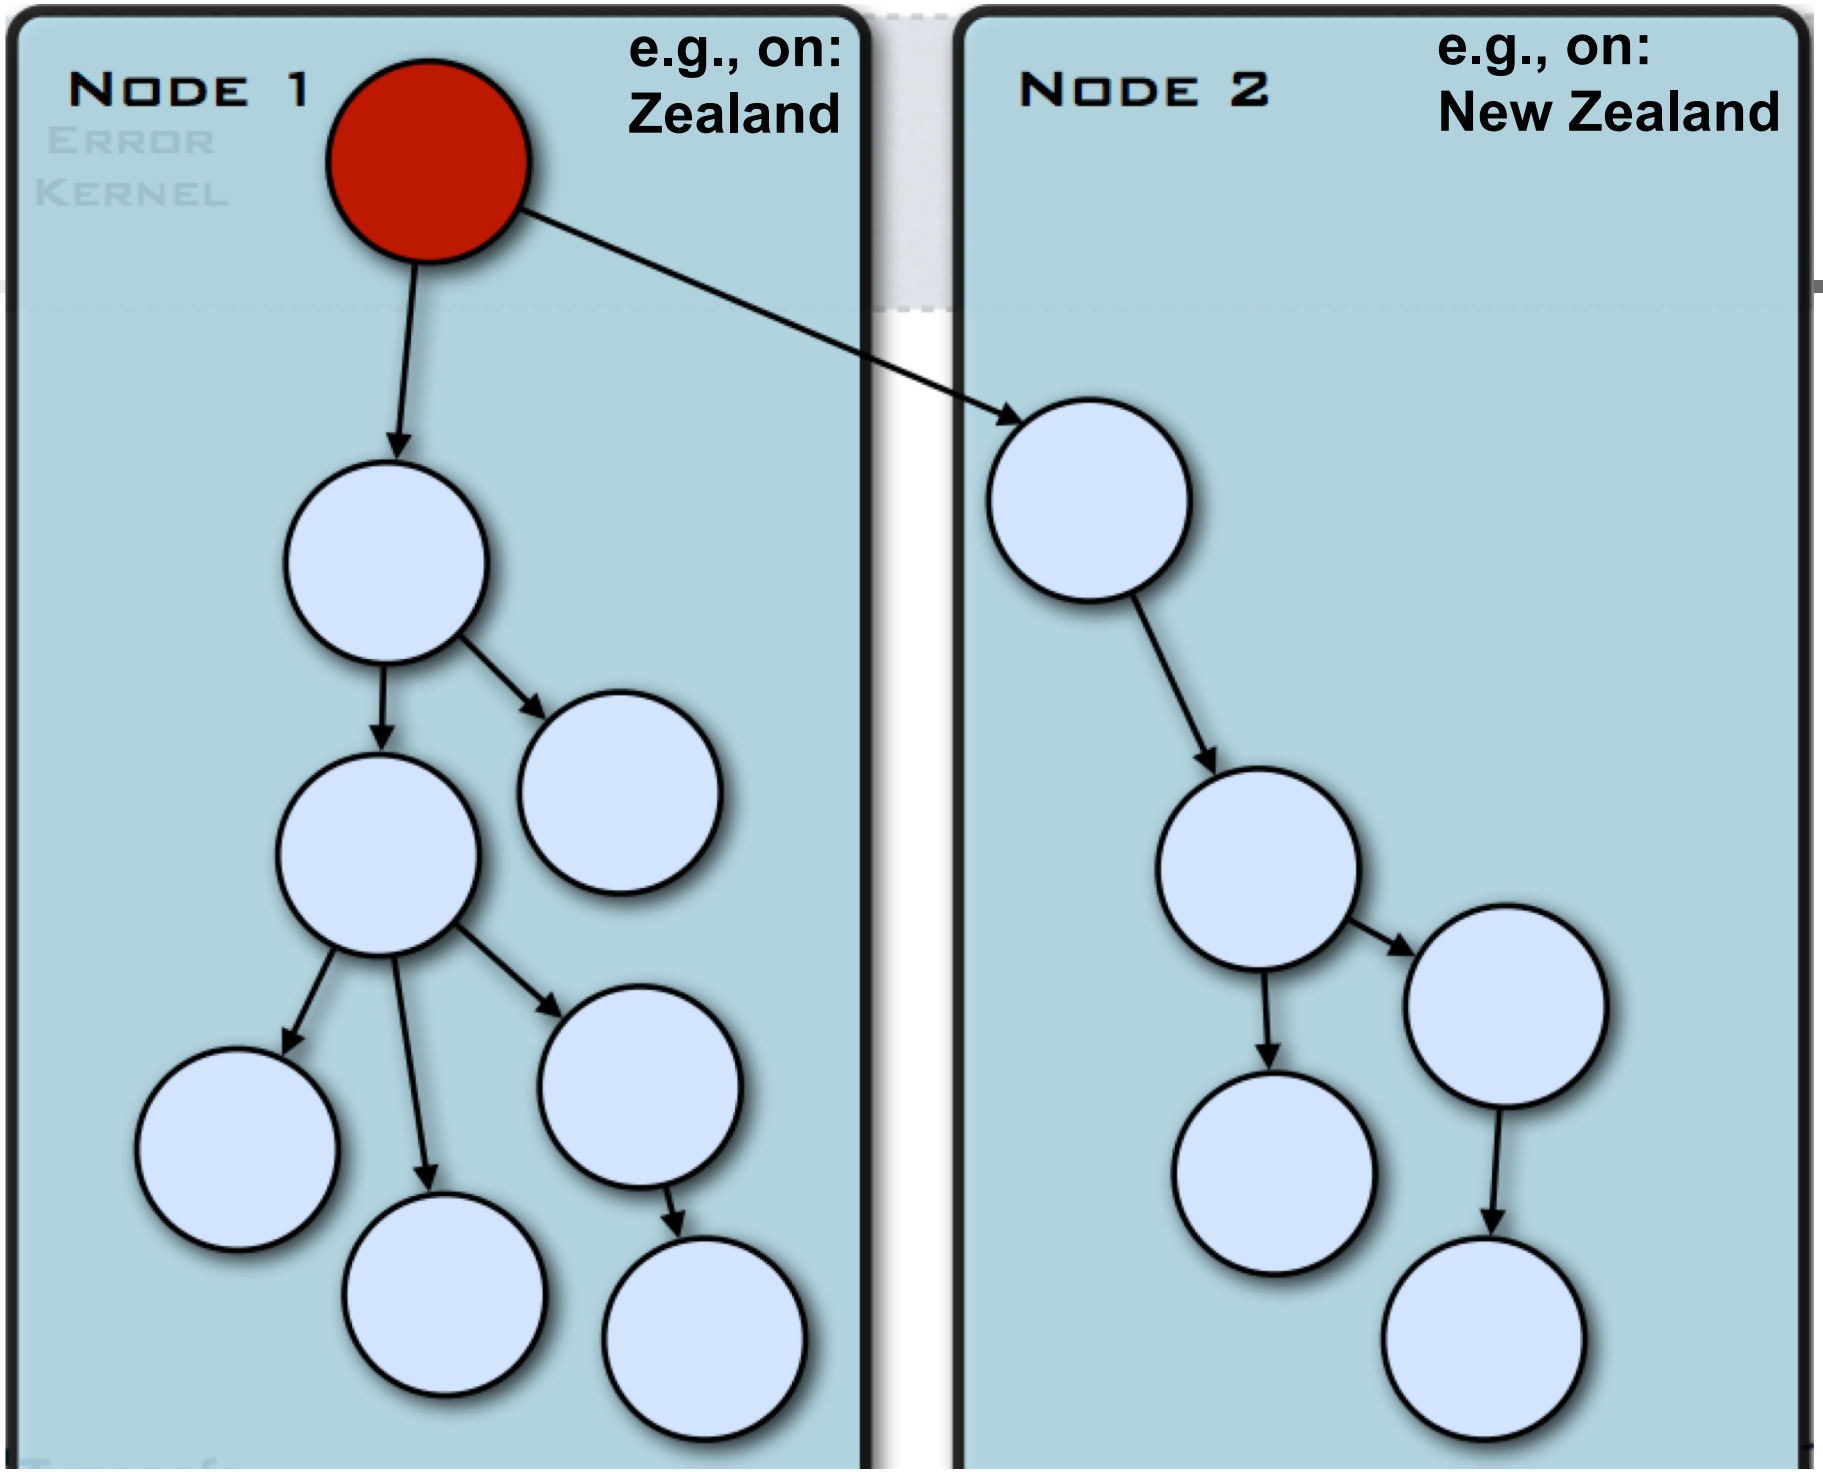
Scalability for free ("scaling up, up, and out")

Fault Tolerance (restart, resume, escalate)

A Hierarchy of Actors

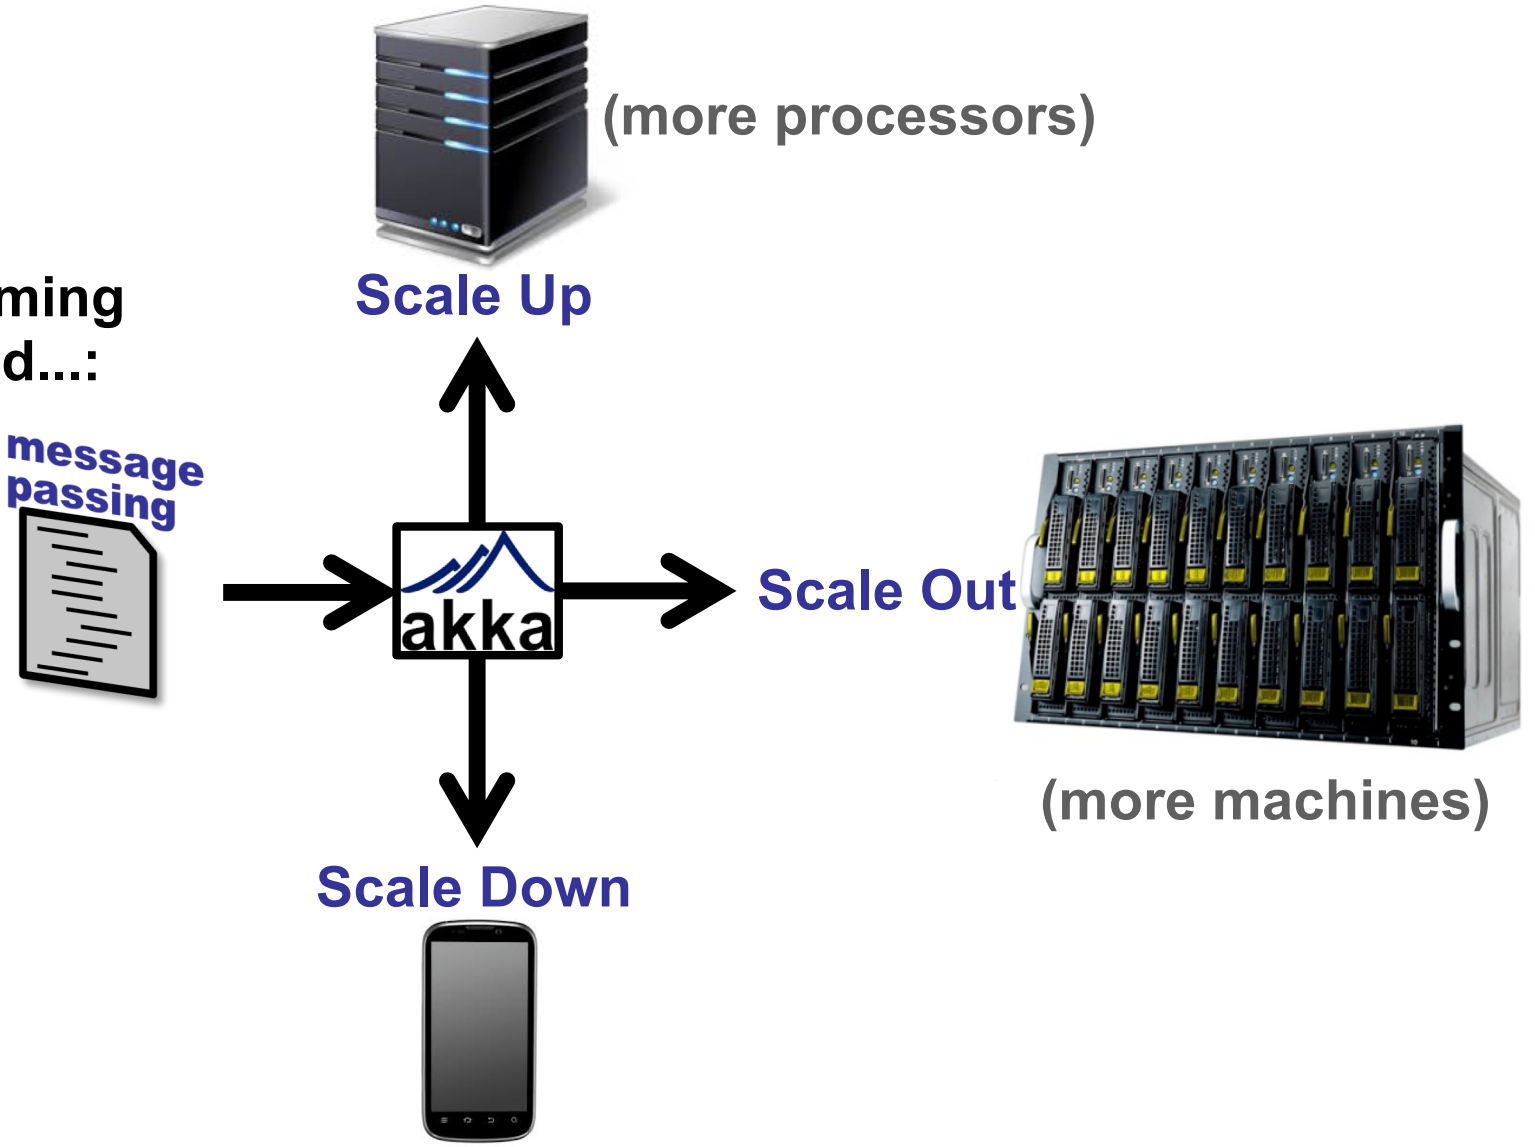


[From "UP UP AND OUT: SCALING SOFTWARE WITH AKKA", Jonas Boner, GOTO Conference, Aarhus, Denmark]



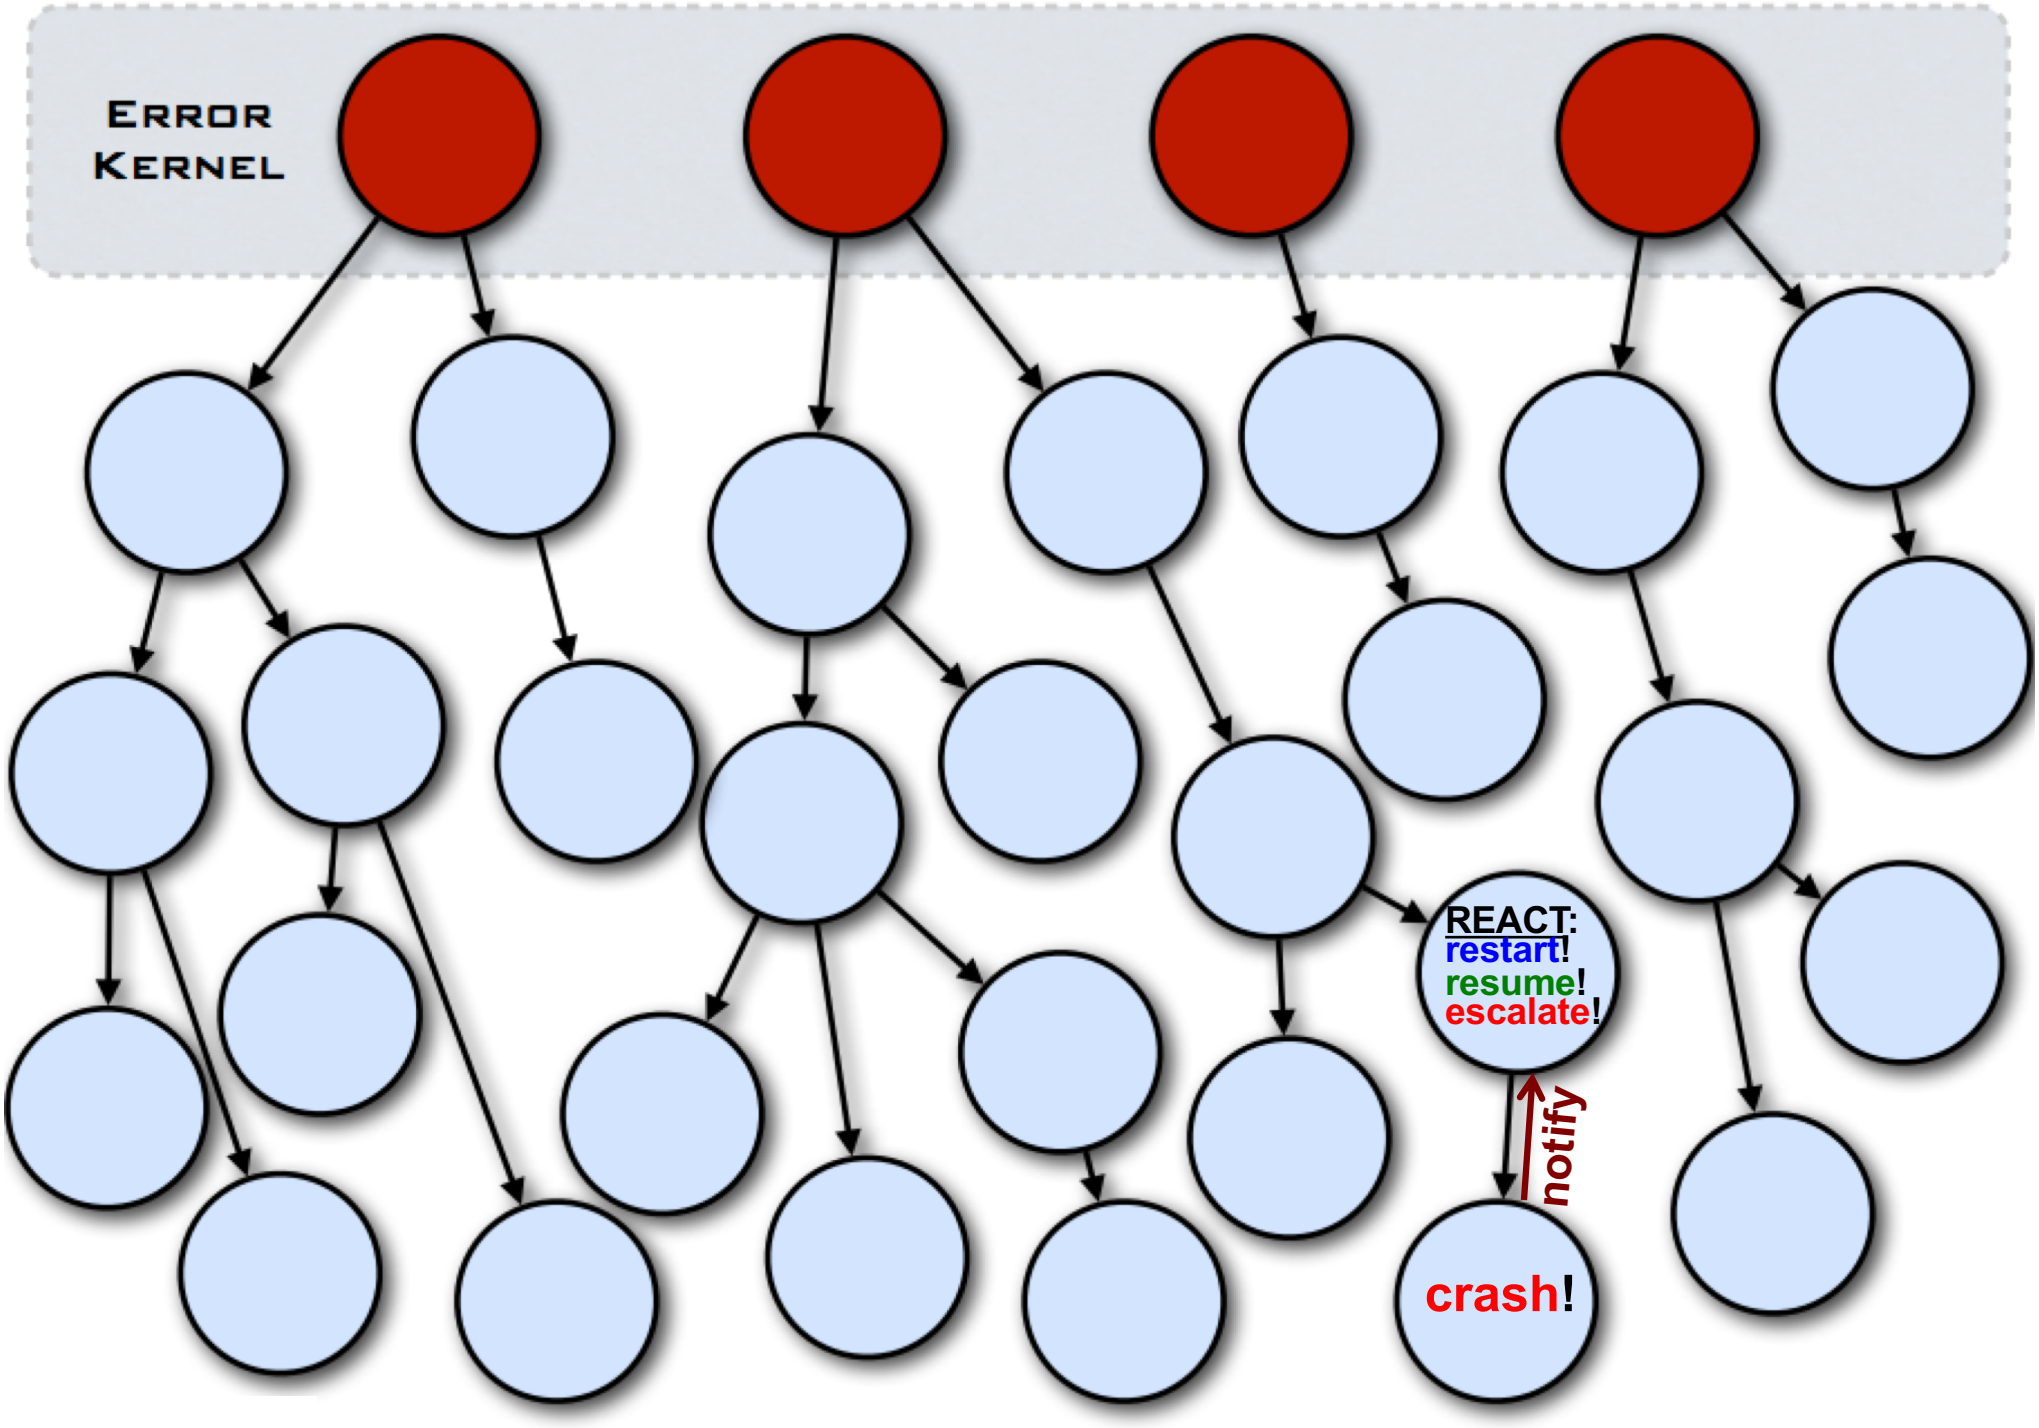
[From "UP UP AND OUT: SCALING SOFTWARE WITH AKKA", Jonas Boner, GOTO Conference, Aarhus, Denmark]

Scale Down, Scale Up, Scale Out



Fault Tolerance

[From "UP UP AND OUT: SCALING SOFTWARE WITH AKKA", Jonas Boner, GOTO Conference, Aarhus, Denmark]



[From "UP UP AND OUT: SCALING SOFTWARE WITH AKKA", Jonas Boner, GOTO Conference, Aarhus, Denmark]

}
```

4) Primer.java

```
spam(_, Max, Max) -> true;
spam(Primer, N, Max) ->
   Primer ! {isprime, N},
   spam(Primer, N+1, Max).
```

```
public class Primer {
    public static int P; // HACK
    public static int MAX = 100;

    private static void spam(ActorRef primer, int min, int max) {
        for (int i=min; i<max; i++) {
            primer.tell(new IsPrimeMessage(i), ActorRef.noSender());
        }
    }

    public static void main(String[] args) {
        final ActorSystem system = ActorSystem.create("PrimerSystem");
        final ActorRef primer =
            system.actorOf(Props.create(PrimeActor.class), "primer");
        primer.tell(new InitMessage(P = 7), ActorRef.noSender());
        try {
            System.out.println("Press return to initiate...");
            System.in.read();
            spam(primer, 2, 100);
            System.out.println("Press return to terminate...");
            System.in.read();
        } catch(IOException e) {
            e.printStackTrace();
        } finally {
            system.shutdown();
        }
    }
}
```

```
start() ->
   Primer = 'spawn'(helloworld, primer, [[]]),
   Primer ! {init,7},
   spam(Primer, 2, 100).
```

4) Primer.java

- Compile:

```
javac -cp scala.jar:akka-actor.jar Primer.java
```

- Run:

```
java -cp scala.jar:akka-actor.jar:akka-config.jar:. Primer
```

- Output:

```
press return to initiate...

initialized (7 slaves ready to work)!

#2: 2
#3: 3
Press return to terminate...

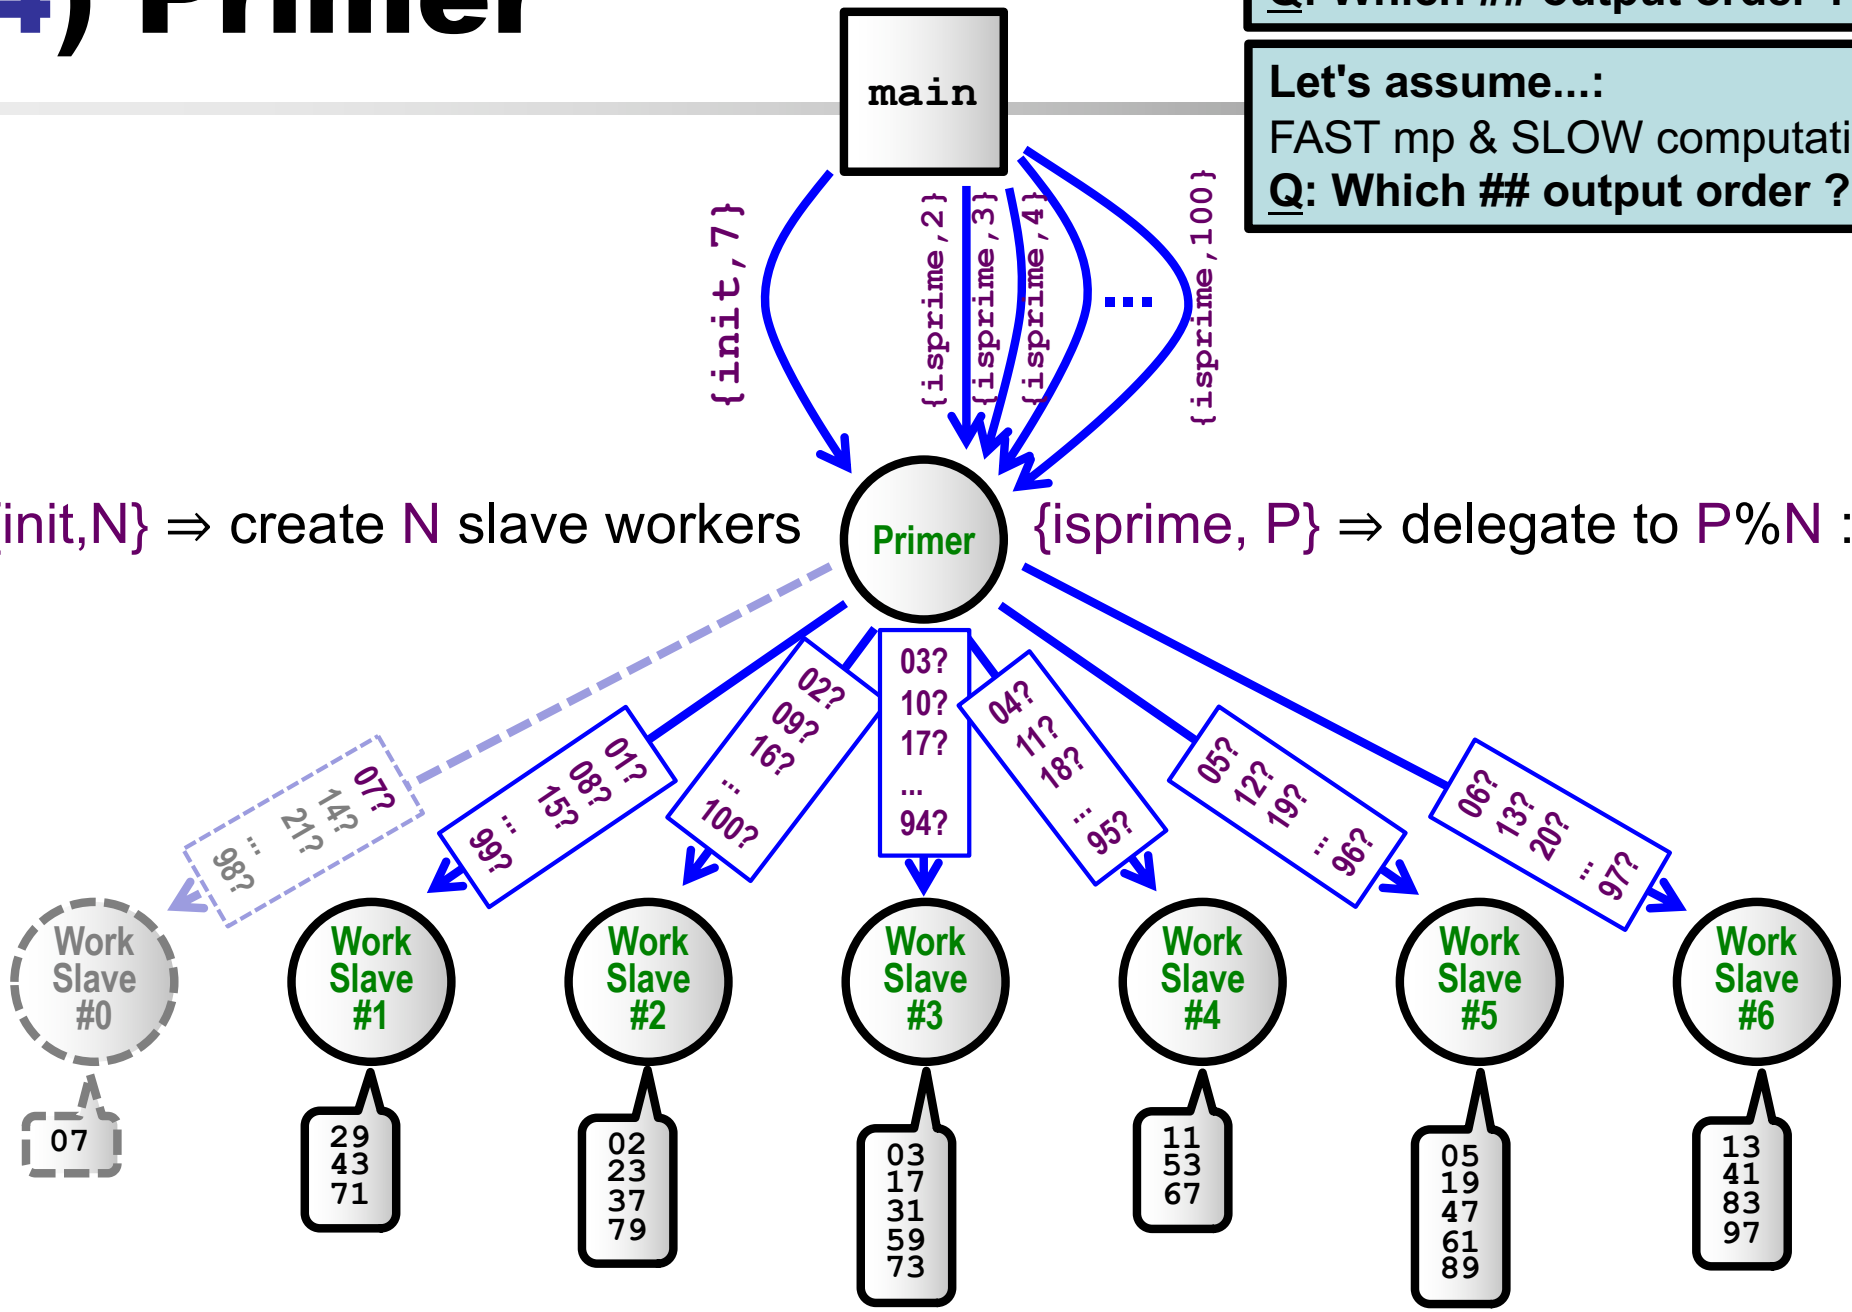
4) Primer

Let's assume...:
SLOW mp & FAST computation
Q: Which ## output order ??

Let's assume...:
FAST mp & SLOW computation
Q: Which ## output order ??



ERLANG -vs- JAVA+AKKA

- **ERLANG:**

FAST message passing*
=predicted=effect=>
You would get numbers in
slave-worker order:
- 07, 29, 02, 03, 11, 05, ...

[observed in ERLANG]

```
#0: 07
#1: 29
#2: 02
#3: 03
#4: 11
#5: 05
#6: 13
#1: 43
#2: 23
#3: 17
#4: 53
#5: 19
#6: 41
..: ..
```

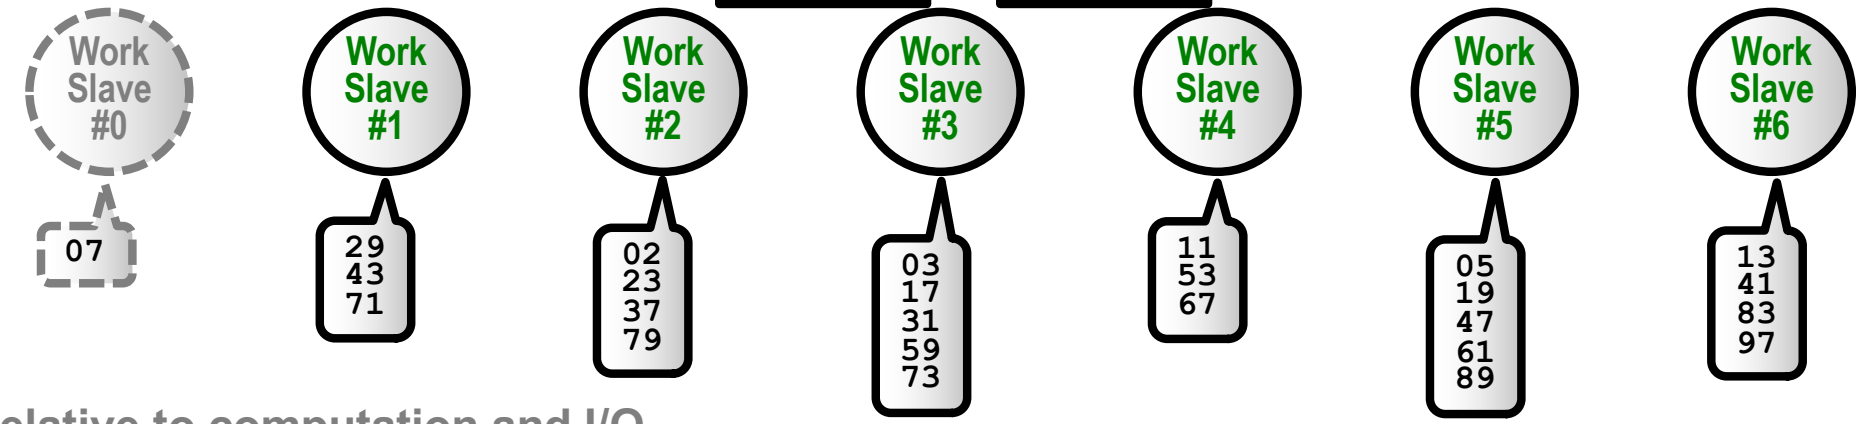
-vs-

```
#2: 02
#3: 03
#5: 05
#0: 07
#4: 11
#6: 13
#3: 17
#5: 19
#2: 23
#1: 29
#3: 31
#2: 37
#6: 41
..: ..
```

- **JAVA+AKKA:**

SLOW message passing*
=predicted=effect=>
You would get numbers in
numerical order:
- 02, 03, 05, 07, 11, 13, ...

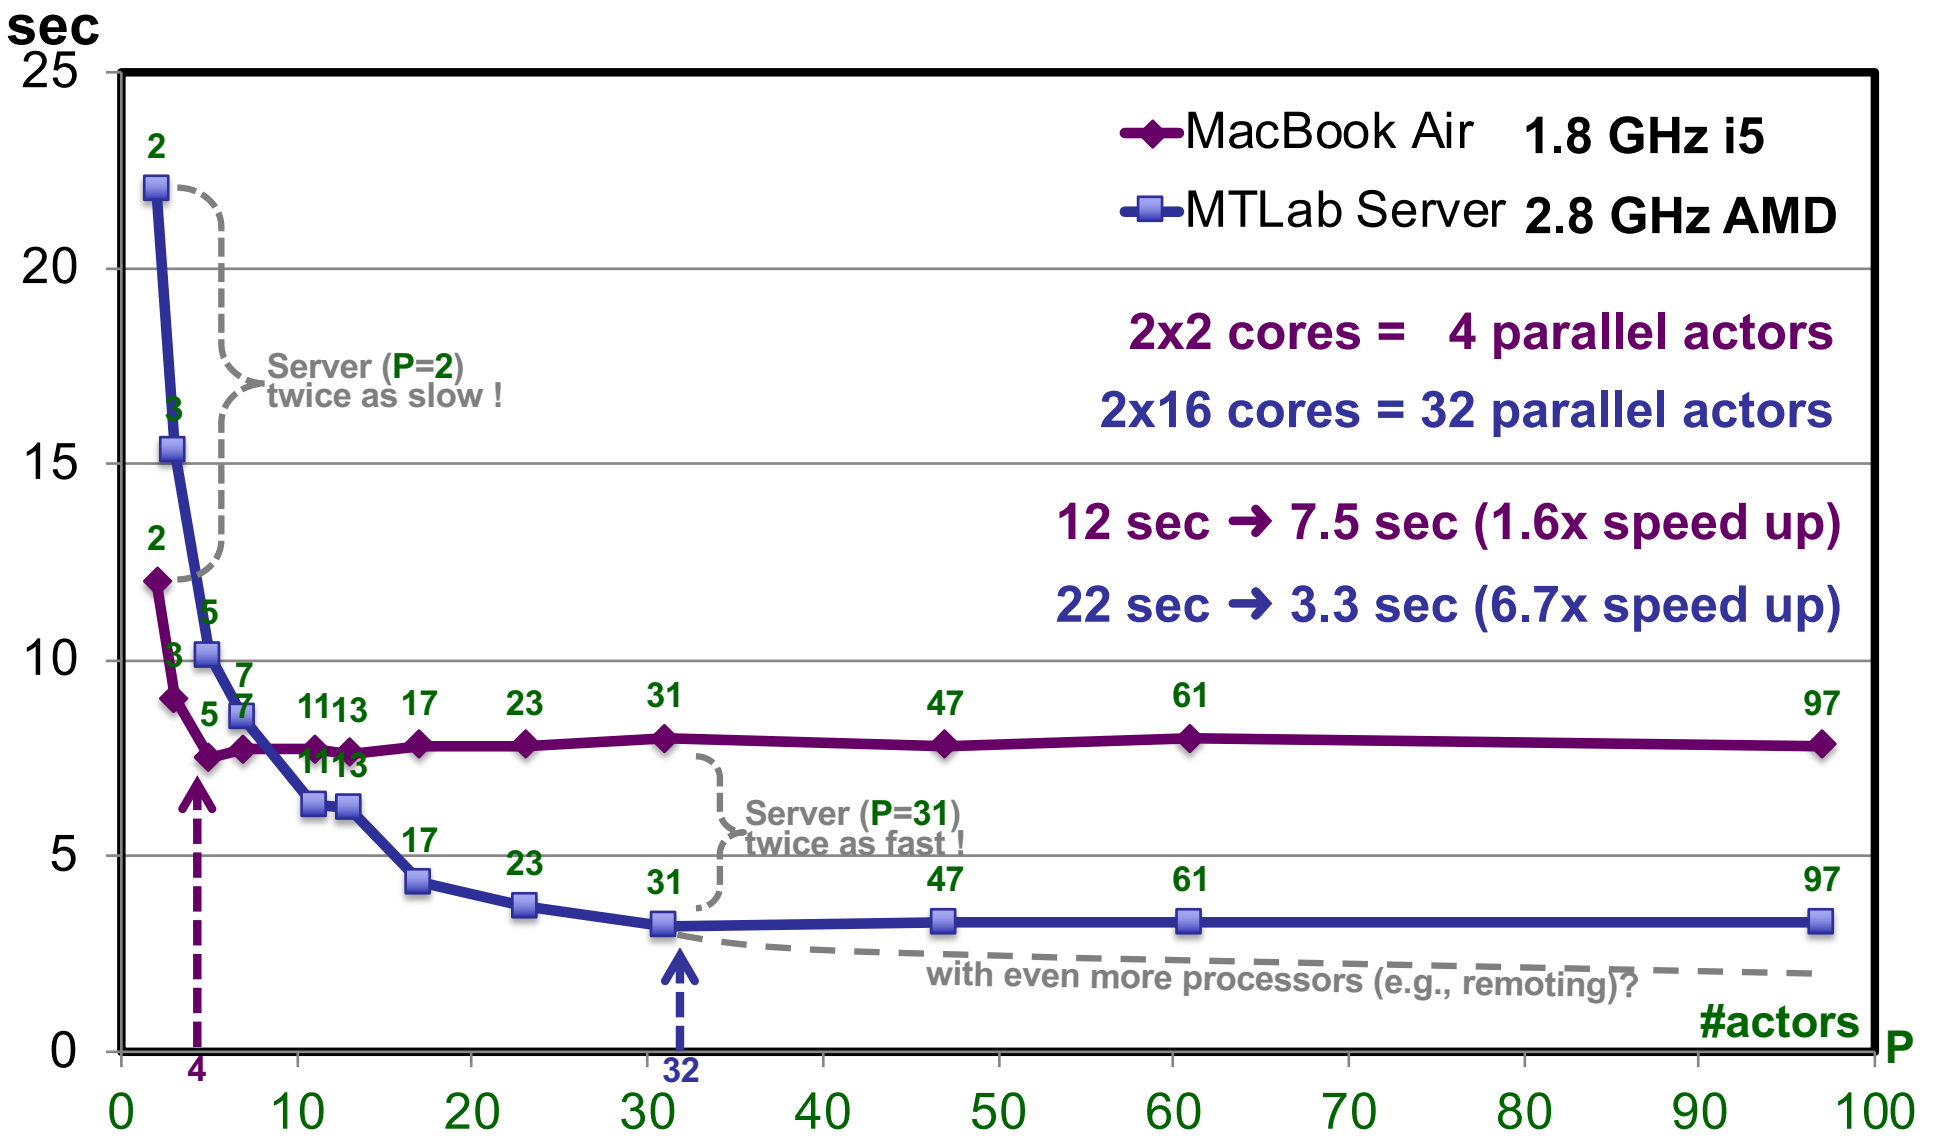
[observed in JAVA+AKKA]



*) relative to computation and I/O

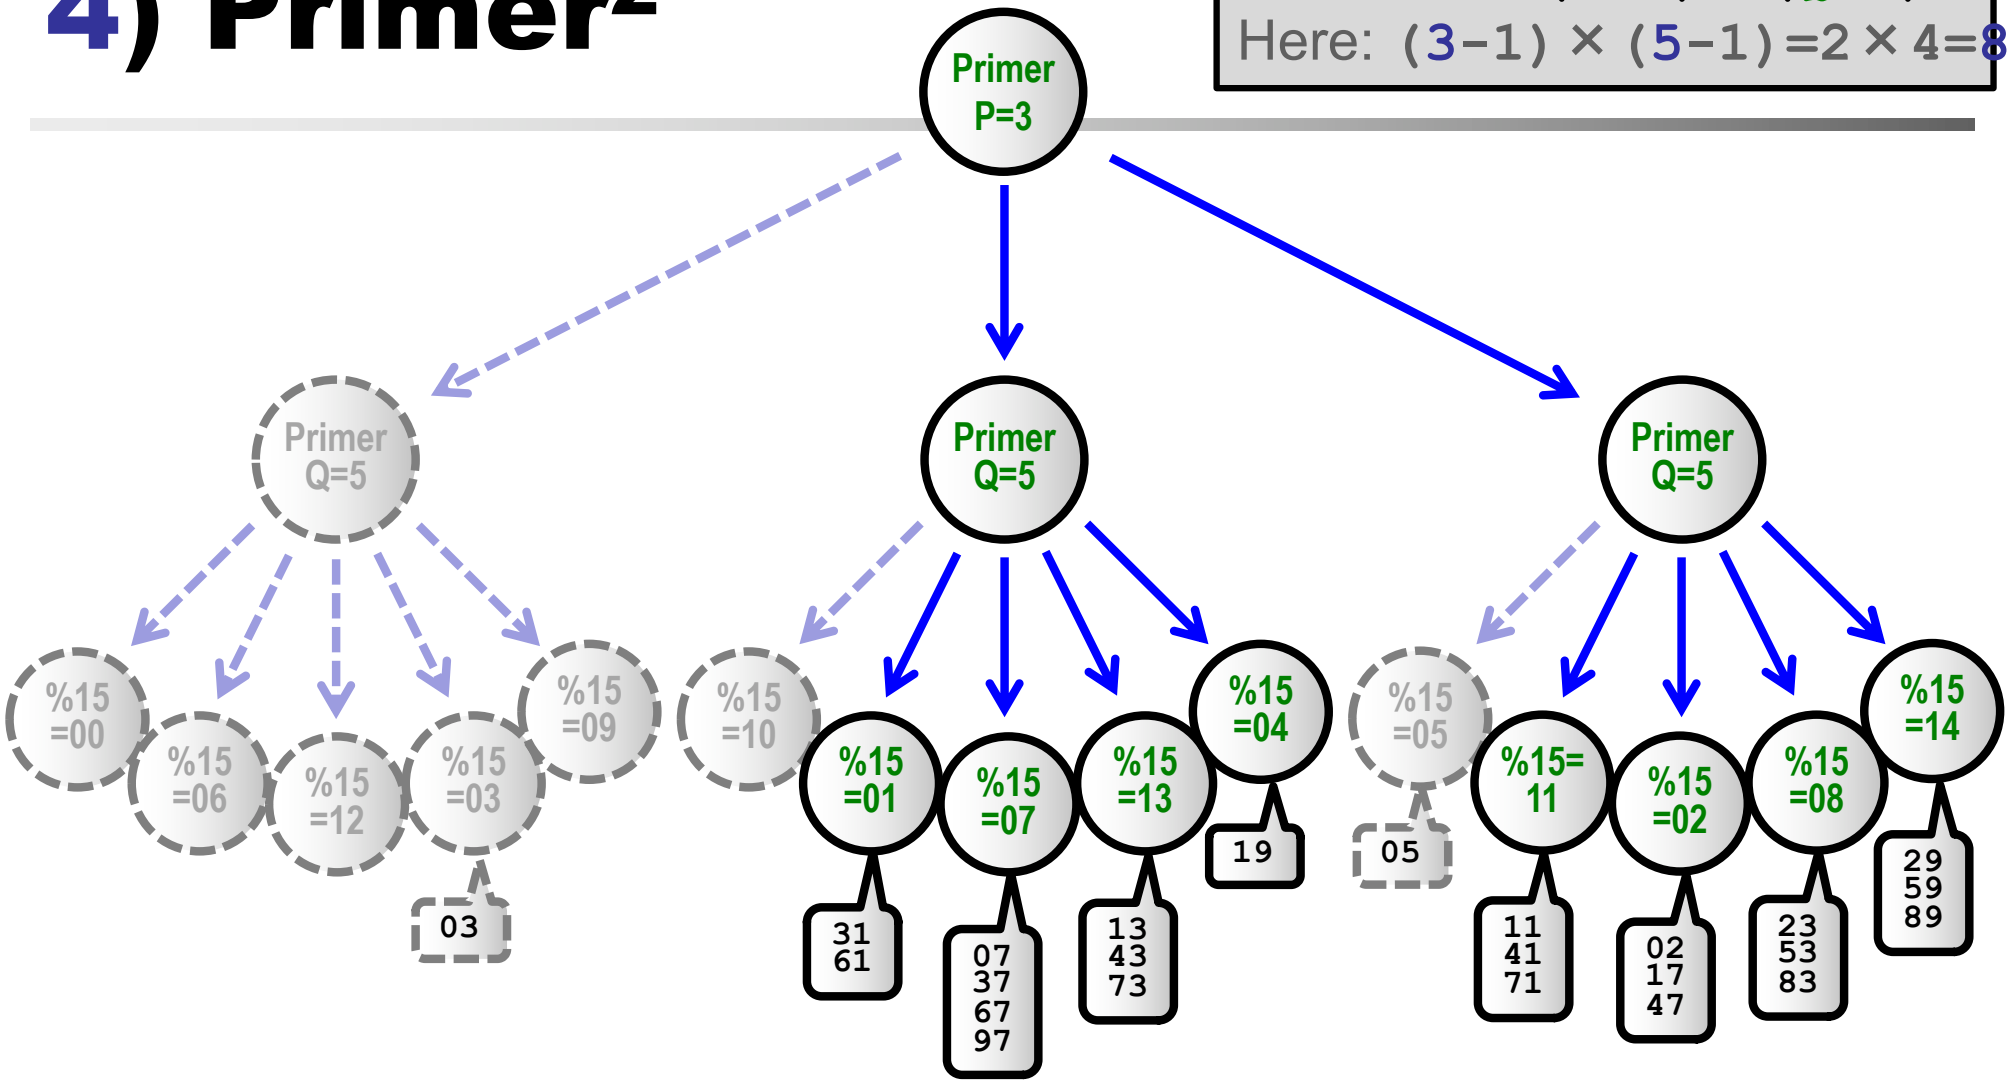
Note: added silly time-consuming computation to every `isPrime()` method call !

Low -vs- High Parallelization !



4) Primer²

#Workers: `P × Q`
#Effective: `(P-1) × (Q-1)`
Here: `(3-1) × (5-1) = 2 × 4 = 8`

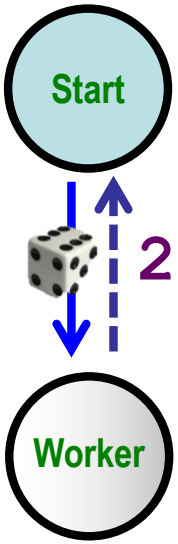


Note: Two primers with P=3 × Q=5 is equivalent to one primer with P=15.
(Note': This is why you should always use a prime # with a hash function.)

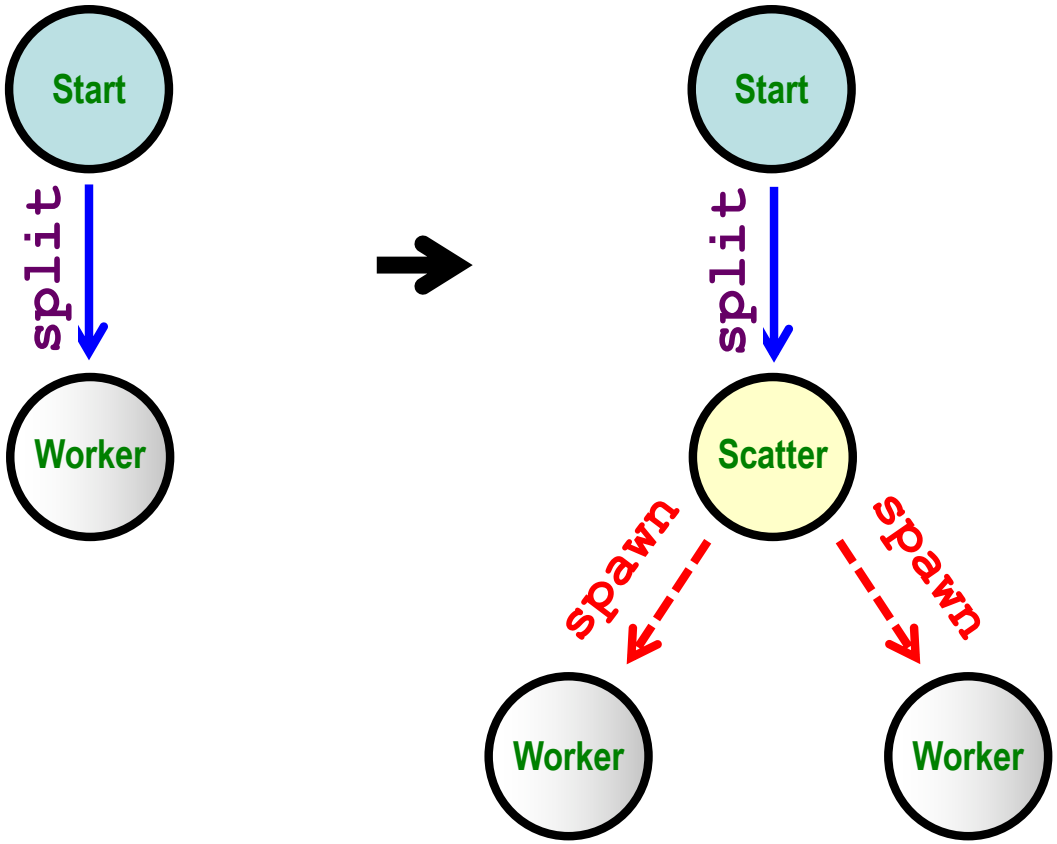
AGENDA

- 3) **Broadcast:**
  - From ERLANG to JAVA+AKKA
  - Communication protocols (one-to-one ⇒ one-to-many)
- **AKKA: A proper introduction**
  - Motivations and benefits of Actors & Message Passing
  - Recommendations
- 4) **Primer:**
  - Hierarchic organization: managers supervise workers
  - Performance: MacBook Air -vs- MTLab Server
- ★ **Scatter-Gatherer:**
  - Prototypical AKKA Service (dynamic load balancing)
  - Extensions

6) Scatter-Gather

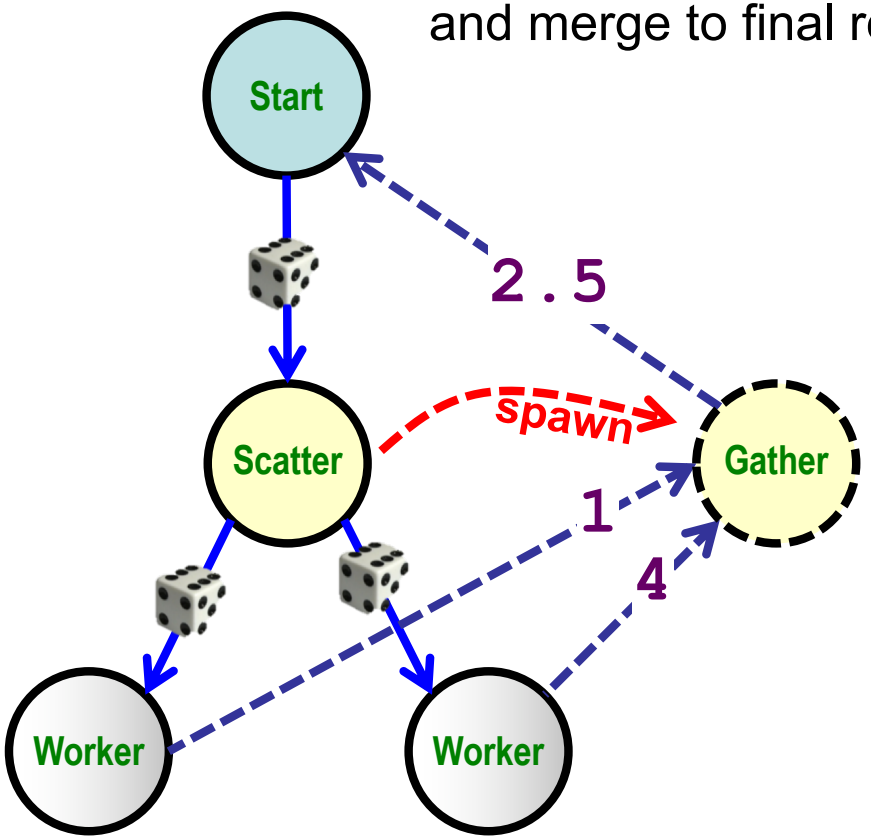


6) Scatter-Gather



6) Scatter-Gather

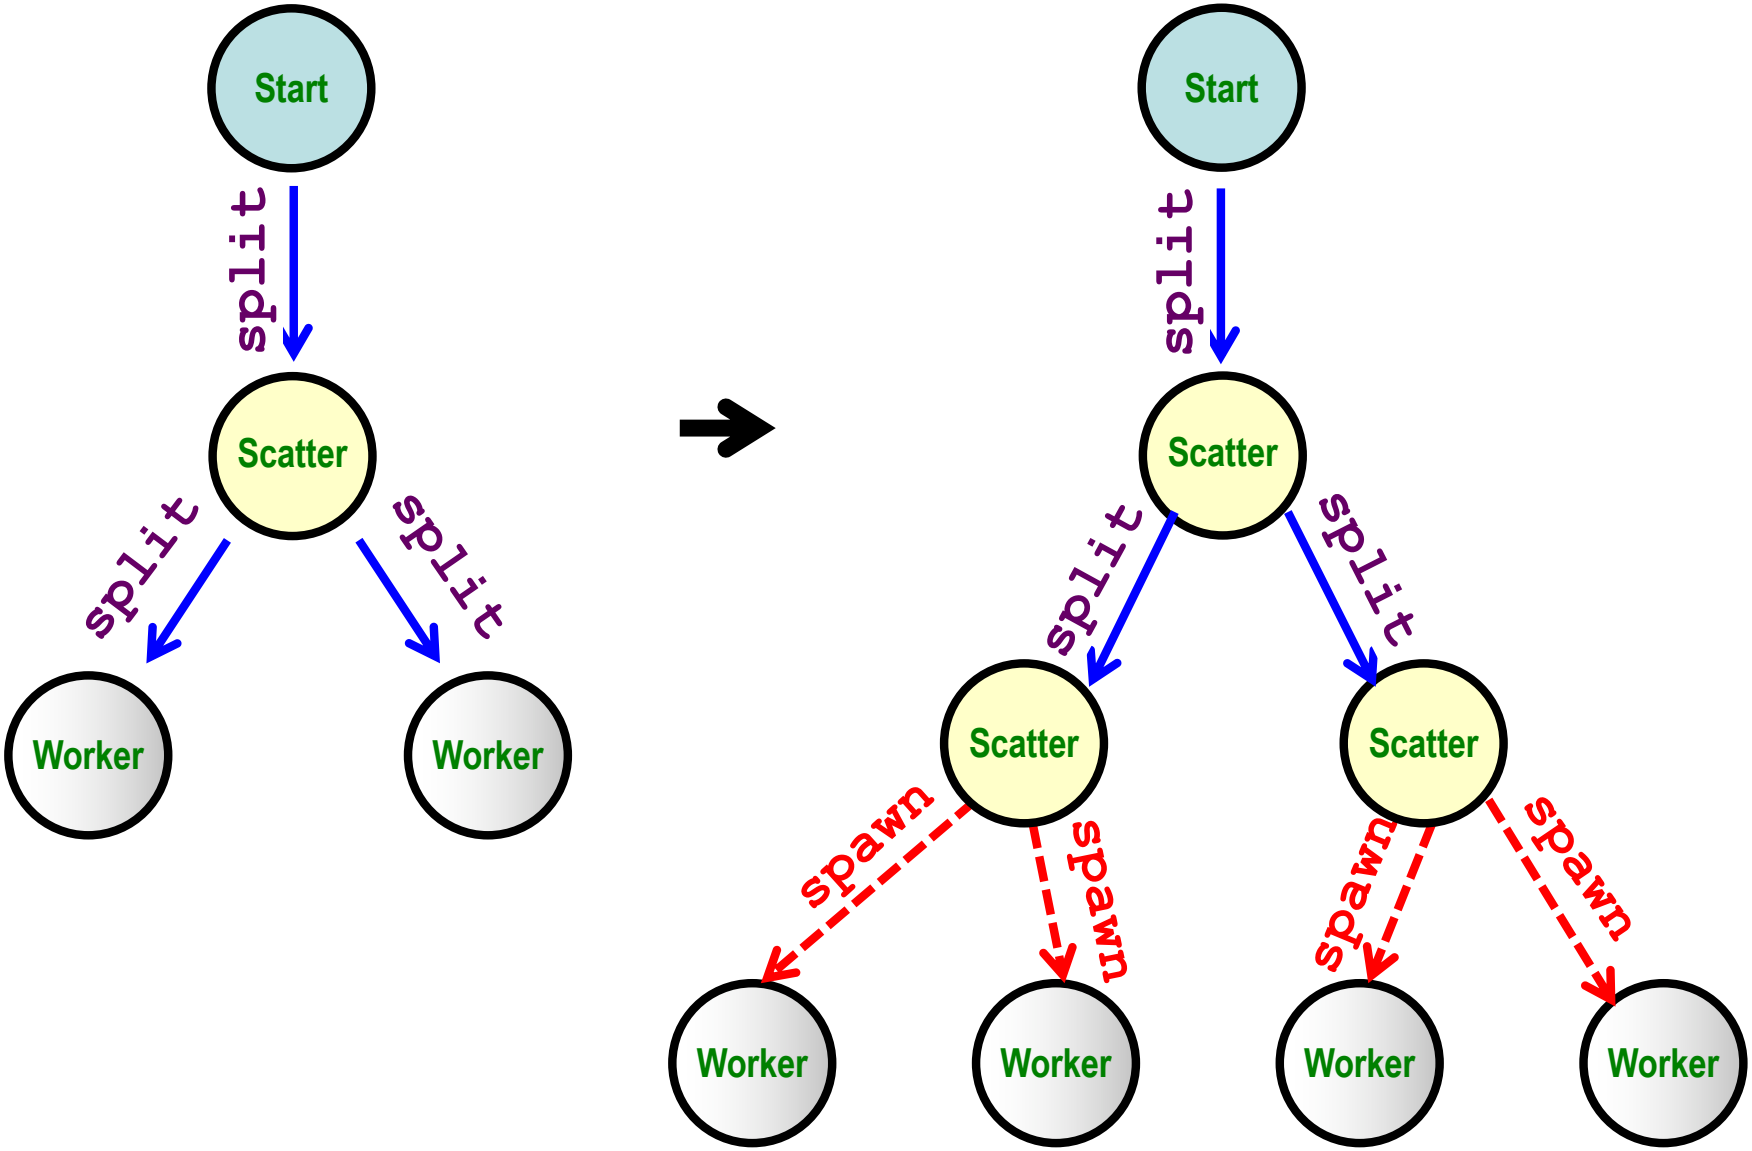
Gatherer:
collect incoming responses
and merge to final result inform its parent



```
-- OUTPUT --
1
4
result = 2.5
```

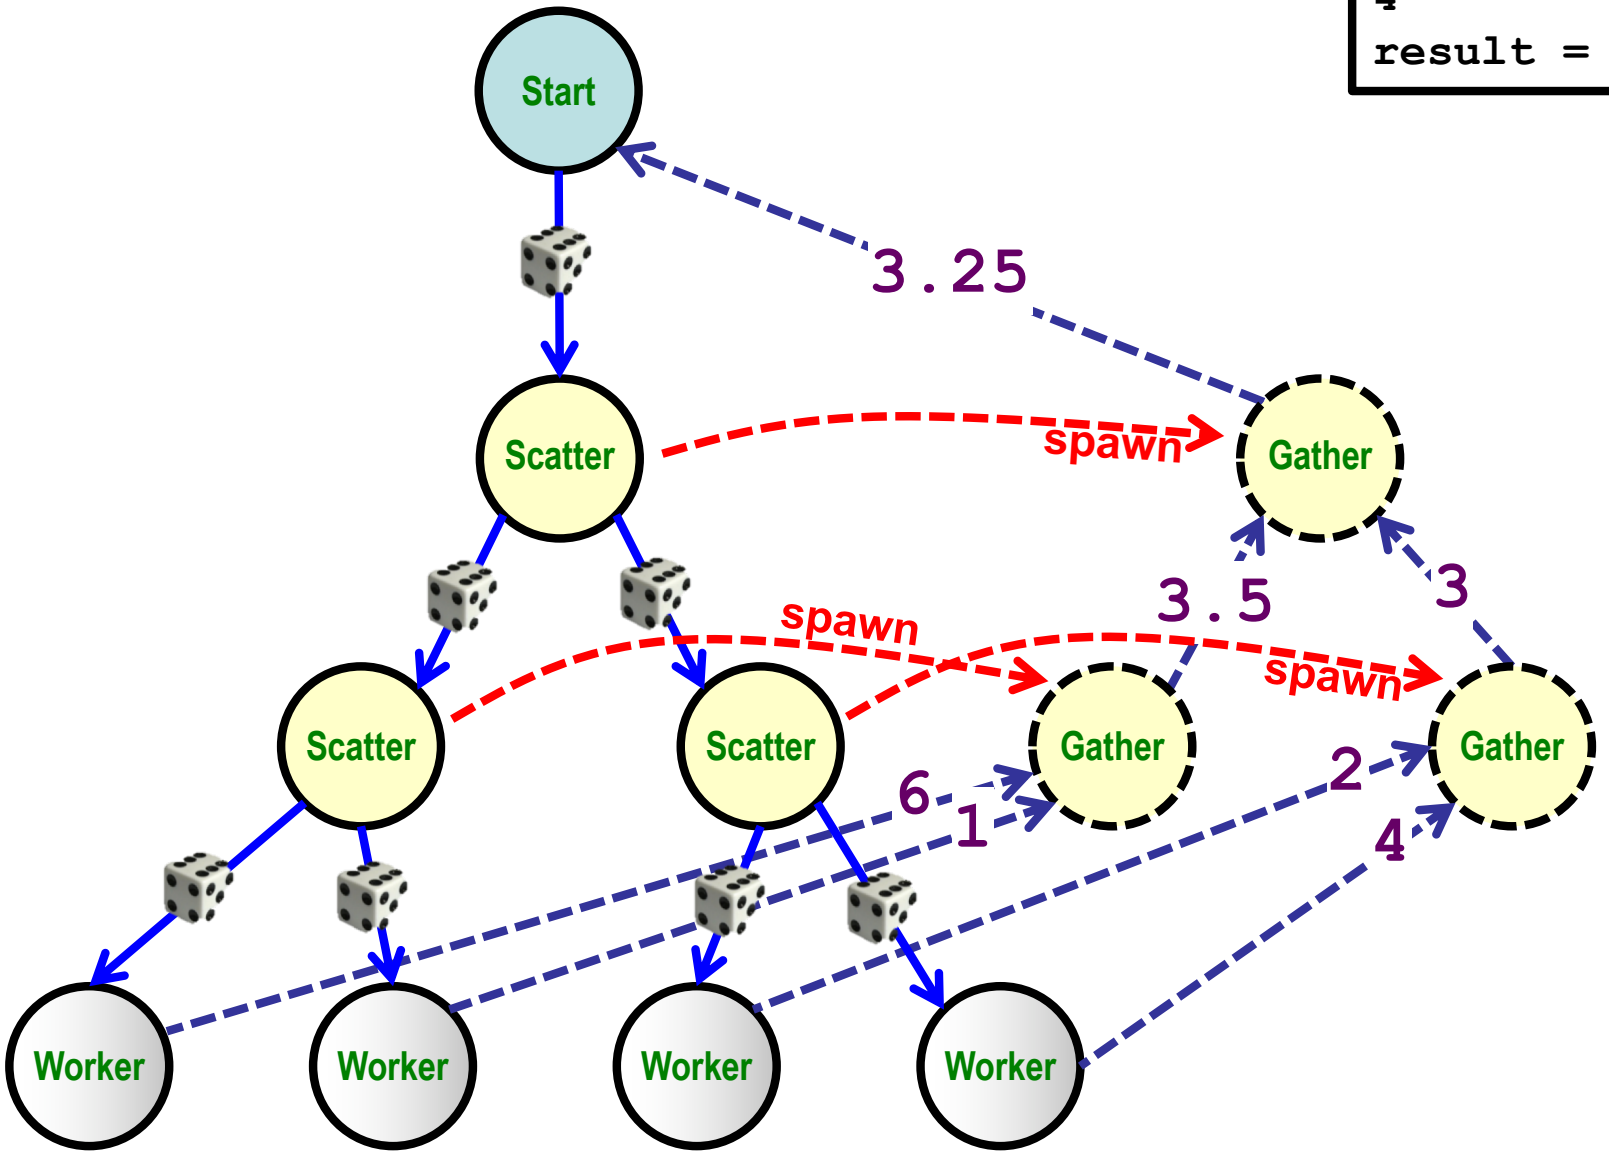
Scatter:
I don't want the result,
send it to my gatherer:
- I'm too busy processing new incoming requests
- besides, it's hard to correlate requests-responses (aka, "the correlation problem")

6) Scatter-Gather

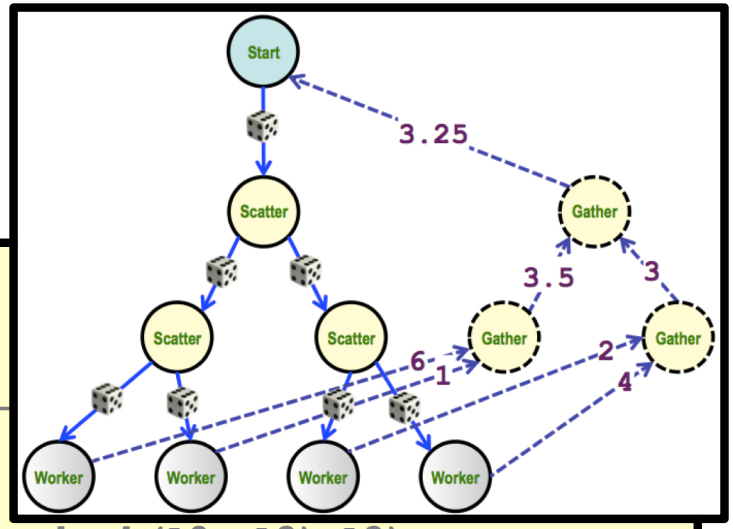


6) Scatter-Gather

```
-- OUTPUT --
6
1
2
4
result = 3.25
```



6) ScatterGather.erl



```
-module(helloworld).
-export([start/0,worker/0,scatter/2,gather/1]).

%% -- COMPUTE ----------------------------------------

seed() -> {_, A2, A3} = now(), %% Seed wrt Time & Pid !
          random:seed(erlang:phash(node(), 100000),erlang:phash(A2, A3),A3).

n2s(N) -> lists:flatten(io_lib:format("~p", [N])). %% HACK: num to string conversion!

random(N) -> random:uniform(N).

compute(X) -> random(X).

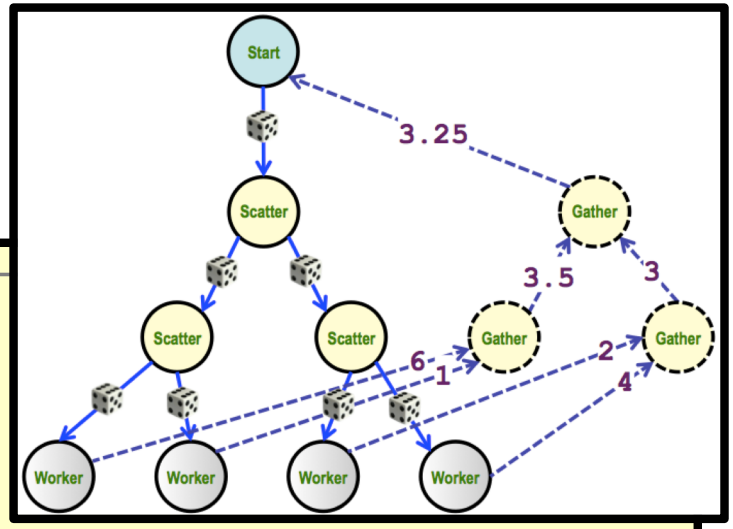
average(X,Y) -> (X + Y) / 2.
```

```
%% -- START ------------------------------------------------

start() ->
   Worker = 'spawn'(helloworld,worker,[]),
   Worker ! split,
   Worker ! split,
   Worker ! {compute,6,self()},
   receive
      {result,R} ->
         io:fwrite("result = " ++ n2s(R) ++ "\n")
   end.
```

```
-- OUTPUT --
6
1
2
4
result = 3.25
```

6) ScatterGather.erl



```
%% -- WORKER ------------------------------
worker() ->
   seed(),
   receive
      split ->
         Left  = 'spawn'(helloworld,worker,[]),
         Right = 'spawn'(helloworld,worker,[]),
         scatter(Left, Right) ;
     {compute,X,Caller} ->
         Res = compute(X),
         io:fwrite(n2s(Res) ++ "\n"),
         Caller ! {result,Res},
         worker()
   end.

%% -- SCATTER -----------------------------
scatter(Left, Right) ->
   receive
      split ->
         Left  ! split,
         Right ! split ;
      {compute,X,Caller} ->
         Gather = 'spawn'(helloworld,gather,[Caller]),
         Left  ! {compute,X,Gather},
         Right ! {compute,X,Gather}
   end,
   scatter(Left, Right).
```

```
%% -- GATHER ------------------------------
gather(Caller) ->
   receive
      {result,Res1} ->
         receive
            {result,Res2} ->
               Res = average(Res1,Res2),
               Caller ! {result, Res} % die!
         end
   end.
```

```
-- OUTPUT --
6
1
2
4
result = 3.25
```

Reception (ERLANG vs AKKA)

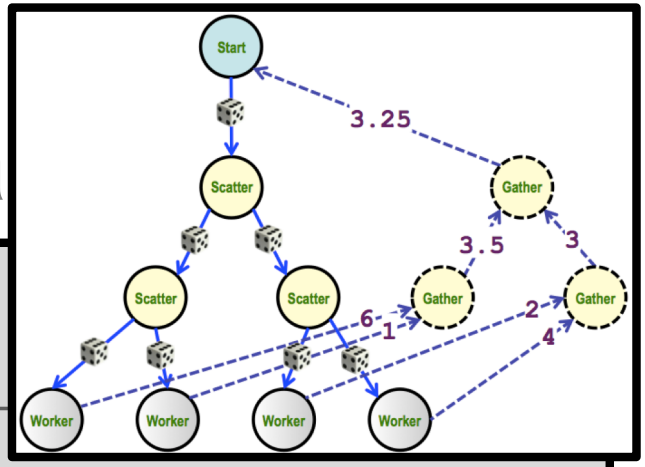
- **In ERLANG:**
  - Locally nested receives (depending on local state)
- **In JAVA+AKKA:**
  - You only have implicit top-level receive `onReceive()`:
- **Example ⇒ refactored (ready) for JAVA+AKKA:**

```
%% -- GATHER ----------------------------
gather(Pid) ->
   receive  // State #0 ('Res1' not set)
      {result,Res1} ->
         receive   // State #1 ('Res1' set)
            {result,Res2} ->
               Res = average(Res1,Res2),
               Pid ! {result, Res} % die.
         end
   end.
```

```
%% -- GATHER' ----------------------------
gather(Pid, Res1) ->
   receive
      {result,Res1} when Res1 = undef ->
         gather(Pid, Res1)
   ;
      {result,Res2} ->
         Res = average(Res1, Res2),
         Pid ! {result, Res} % die.
   end.
```

[See also ERLANG Book, program 5.3]

6) ScatterGather.java



```
import java.util.Random;   import java.io.*;
import akka.actor.*;

// -- MESSAGES ------------------------------------------

      }
   }
}
```

```
-- OUTPUT --
6
1
2
4
result = 3.25
```

Scatter-Gatherer + ...

- **Adaptive Load balancing:**
  - Monitor system to extract up-to-date statistics
  - Based on statistics, adjust system capacity (cf. our split) or Quality-of-Service (ak²a, "graceful degradation")
    - Note: this may be done on ***all*** nodes in the hierarchy!
- **Memoization/Caching:**
  - Often, memoization is used to "cache" already-performed-computations `// Map<Key,Val> cache;`
    - Note: this may be done on ***all*** nodes in the hierarchy!
- **Fault Tolerance:**
  - Supervisors react if workers don't respond or crash
  - Then: resume(), subtree.restart(), parent.escalate()
